

2015 University Turbine Systems Research Workshop  
Co-organized by DoE Office of Fossil Energy, DOE NETL, and Georgia Tech  
2-5 November 2015

# Challenges in Measuring the HTC for Turbine Cooling

**Tom I-P. Shih and C.-S. Lee**

School of Aeronautics and Astronautics, Purdue University

**Mark Bryden**

Ames National Laboratory, U.S. Dept. of Energy

**Robin Ames and Rich Dennis**

National Energy Technology Laboratory, U.S. Dept. of Energy

DoE – NETL & Ames Laboratory

# Our research group's focus is on turbine cooling.

## Current efforts include:

- LES of ingress/egress through rim seals that accounts for rotor-stator interactions.
- LES of internal & film cooling aimed at generating statistics to guide the development of RANS models.
- Inflow BC for LES and BC at the interface between LES and RANS for hybrid methods.
- Develop reduced-order methods from CFD for system-level tools.
- Examine fundamental issues in computing & measuring heat-transfer relevant to turbine cooling.

Liu & Shih

# Outline of Talk

## Revisit

- HTC measured by transient methods
- HTC measured by steady-state methods

## What else?

- $Nu = F(Re, Pr, \text{geometry})?$

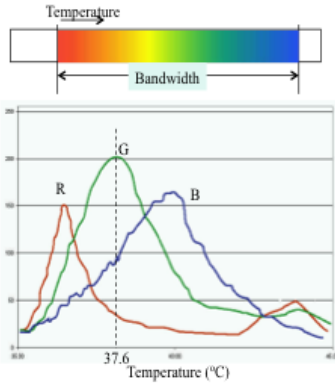

## Summary & Current Work

# Measurements of HTC by Transient Methods

Measurements are needed to **validate** CFD tools.

A widely used method is the **thermochromic liquid crystal technique**.

Thermochromic Liquid Crystal (TLC)

green light reflection gives the best intensity.

Surface temperature is measured as a function of time.

The heat transfer coefficient is then inferred from either 1-D or 0-D exact solutions.

One equation method

$$\frac{T_w - T_i}{T_b - T_i} = 1 - \exp\left[-\frac{h^2 \alpha t}{k^2}\right] \operatorname{erfc}\left[\frac{h\sqrt{\alpha t}}{k}\right]$$

Two equation method

$$\frac{T_{w1} - T_i}{T_b - T_i} = 1 - \exp\left[-\frac{h^2 \alpha t_1}{k^2}\right] \operatorname{erfc}\left[\frac{h\sqrt{\alpha t_1}}{k}\right]$$

$$\frac{T_{w2} - T_i}{T_b - T_i} = 1 - \exp\left[-\frac{h^2 \alpha t_2}{k^2}\right] \operatorname{erfc}\left[\frac{h\sqrt{\alpha t_2}}{k}\right]$$

'h' can be calculated with known values of  $T_{bulk}$

'h' & ' $T_{bulk}$ ' can be found by solving the two equations

1-D Model

Assumptions:

- constant  $h, k, C_p$
- constant  $T_{bulk}$
- $h_{transient} = h_{steady-state}$

$$\frac{T_{wall}(t) - T_{initial}}{T_{bulk} - T_{initial}} = 1 - \exp\left(-\frac{h^2 \alpha t}{k^2}\right) \operatorname{erfc}\left(\frac{h\sqrt{\alpha t}}{k}\right)$$

0-D Model

Experimental Technique:

- Measures  $T = f(\text{time})$
- Calculate  $h$  at time when  $T = 37.6 \text{ }^\circ\text{C}$

$$\frac{T_{wall}(t) - T_{bulk}}{T_{initial} - T_{bulk}} = \exp\left[-\left(\frac{h A_s}{\rho V C_p}\right) t\right]$$

Constant  $T_{bulk}$ , Variable HTC

$T_{bulk, \text{inlet}} = 350 \text{ K} = 76.85 \text{ }^\circ\text{C}$   
 $T_{\text{surface, initially}} = 300 \text{ K} = 26.85 \text{ }^\circ\text{C}$

Variable  $T_{bulk}$  and HTC

# HTC: 1-eq vs 2-eq vs URANS & RANS at the time $T_{\text{surface}} = 37.6 \text{ }^\circ\text{C}$

## Error due to 3-D variation

- < 4% for 1-eq
- up to 30% for 2-eq.

## Error due to unsteady T on wall

- up to 16%

Error at Extra points

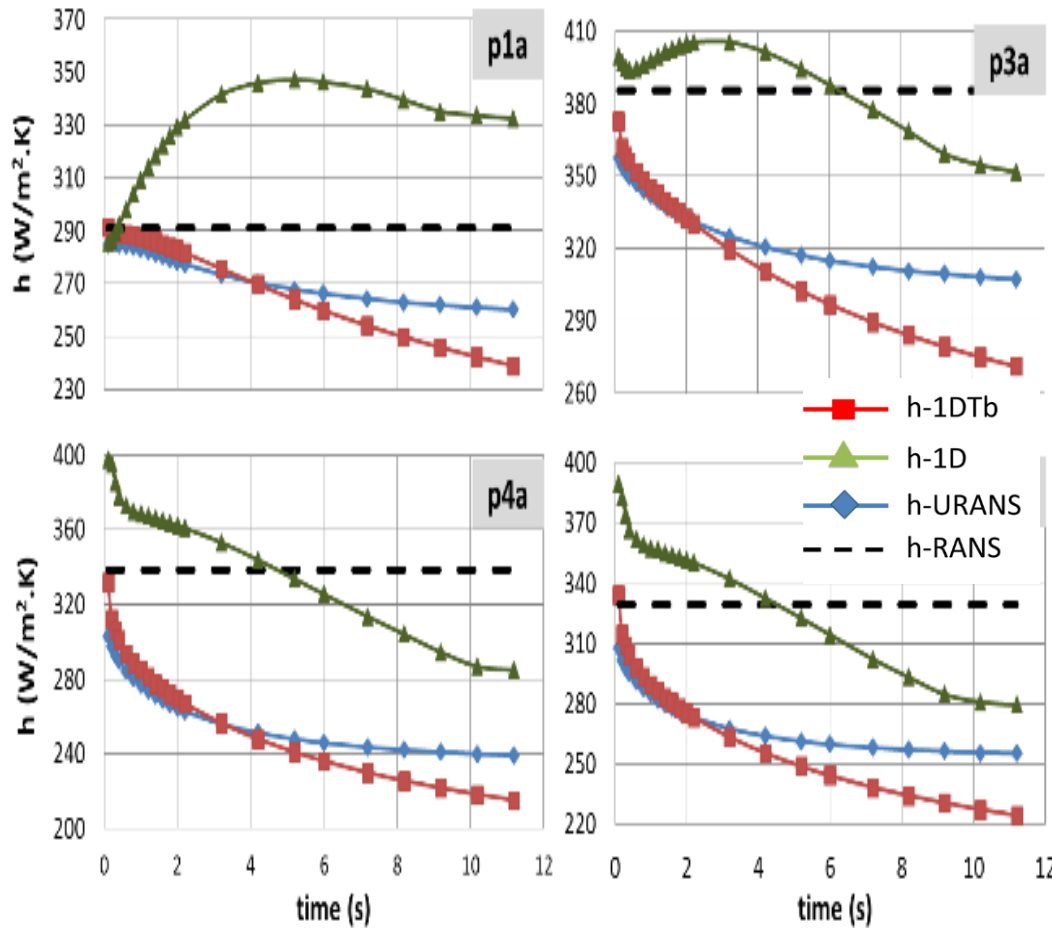

$$E\text{-URANS} = (h\text{-URANS} - h\text{-RANS}) / h\text{-RANS}$$

$$E\text{-1DTb} = (h\text{-1DTb} - h\text{-URANS}) / h\text{-URANS}$$

$$E\text{-1D} = (h\text{-1D} - h\text{-URANS}) / h\text{-URANS}$$

# Measurements of HTC by Transient Methods

- HTC measured by transient methods **differ** from the HTC under steady-state conditions with isothermal walls (up to 17% for the pin-fin problem and up to 26% for the rib problem).
- HTC measured by the transient methods vary appreciably in time (up to 31% over 10 seconds). Thus, it is unclear which HTC measured is the correct or the meaningful one.

**Sathyanarayanan,  
Ramachandran, Shih, et al.  
(AIAA 2015-1195)**

# Measurements of HTC by Steady-State Methods

## Issues:

- Lab vs engine-relevant conditions? Will data from lab conditions be useful?
- Since  $HTC = f(\text{wall BC: } T \text{ or } q'')$ , what are the effects of imposing constant  $q''$ , which is what is typically used?
- What are the effect of the plate thickness and its material properties on the HTC?

# Problem Description

## Cooling condition

$$Re_D = 50,000$$

$$T_c = 400 \text{ } ^\circ\text{C}$$

$$P_b = 25 \text{ atm}$$

$$* Re_D = \frac{\rho V_{max} D}{\mu}$$

$$h/D = 1$$

$$S_x/D = 2.5$$

$$S_y/D = 5$$

$$t/D = 0, 0.5, 1$$

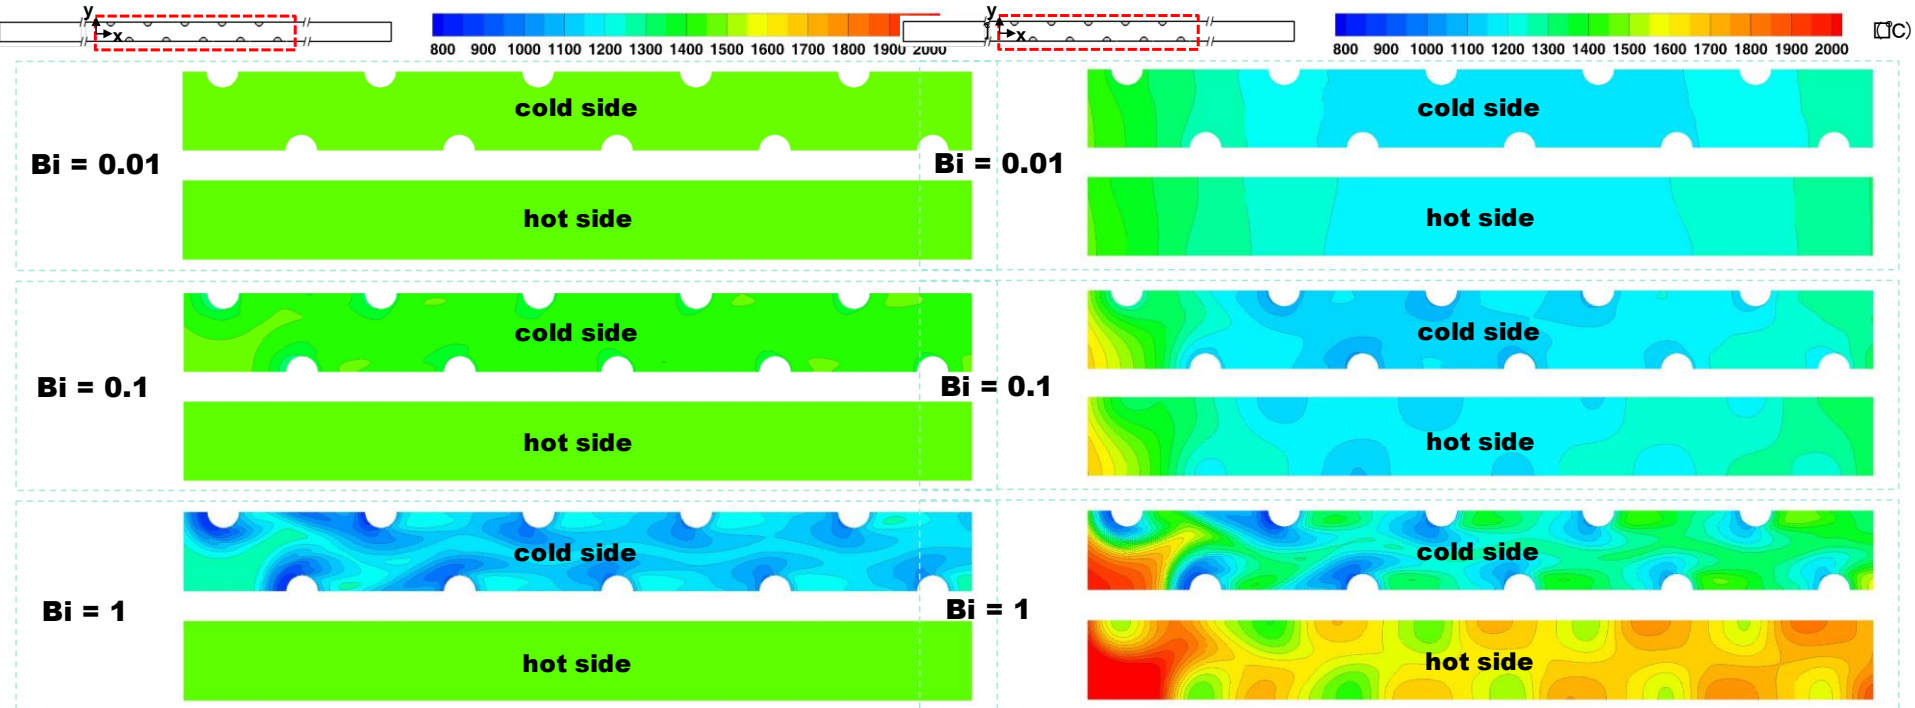

Case	Heating BCs

Temperature

# Energy-balance $T_{\text{bulk}}$ v.s. linear $T_{\text{bulk}}$

For this problem, approximating  $T_{\text{bulk}}$  by linear interpolation is OK because the variation in  $T$  is small.

# Outline of Talk

## Revisit

- HTC measured by transient methods
- HTC measured by steady-state methods

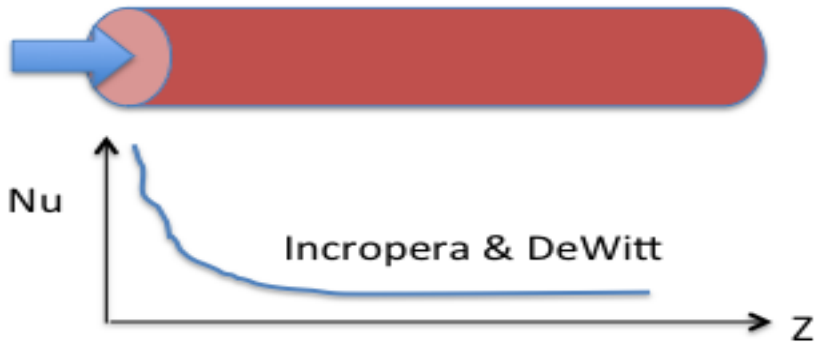

## What else?

- Bulk Temperature?
- $Nu = F(Re, Pr, \text{geometry})?$

## Summary & Current Work

# Example 1: Bulk Temperature and Heat-Transfer Coef.

$$q'' = h (T_{\text{wall}} - T_b) \quad T_b = \frac{\int_A \rho u C_p T dA}{\int_A \rho u C_p dA}$$

$$\text{Nu} = h D_h / k$$

$T_b$  is hard to measure. Why?

- an integral!
- Which cross section around the bend?
- How to handle flow separation, ribs, pin fins, ...?

Bulk temperature is almost always approximated in EXPERIMENTS but rarely documented.

- What are the consequences of the approximations?
- How should HTC be measured and used in V&V and in design?

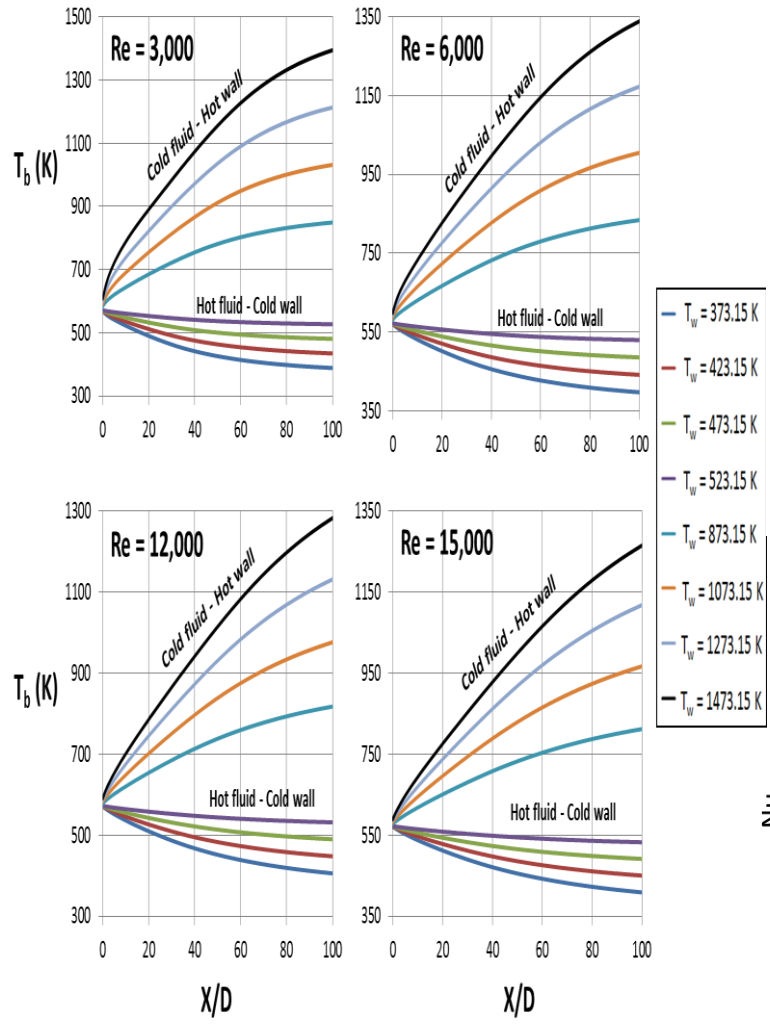

Chi & Shih (AIAA 2012-0807)

# Example 2: Heat-Transfer Coef. & Reynolds No.

$$T_b = \frac{\int_A \rho u C_p T dA}{\int_A \rho u C_p dA}$$

$$Re = \rho_{in} V_{in} D_h / \mu, \quad \mu = f(T_b)$$

In turbine cooling, the local Re can vary appreciably along the duct.

$$q'' = h(T_w - T_b)$$

$$Nu = hD/k, \quad k = k(T_b)$$

$q'' = 200\text{KW/m}^2$   $\overline{Nu} = 0.115\overline{Re}_D^{0.68}$

$q'' = 400\text{KW/m}^2$   $\overline{Nu} = 0.009\overline{Re}_D^{0.95}$

# Summary

Measuring HTC by transient methods could have some issues.

Measuring HTC by steady-state methods is relatively independent of the BC imposed on the wall surface.

The Re in an internal cooling passage may vary appreciably along the passage because of the rise in coolant temperature from 400 °C to 700 or 800 °C.

HTC is currently obtained under conditions, where  $T_w/T_b$  is near unity. Thus, scaling of HTC is needed. The question is how?
