Developing the Technologies and
Building the
Infrastructure for CO₂ Storage

August 21-23, 2012

- Program and Project Benefits
- Technical Status
 - Brief Introduction to integrated path differential absorption concentration measurements
 - 1 x N fiber sensor array description
 - Experimental results
- Program accomplishments and summary

Benefit to the Program

- Program Goals Addressed:
 - Develop technologies to demonstrate that 99% of CO₂ remains in the injected zones.
 - Conduct field tests for site operations (monitoring/verification/accounting)
- Project Benefits

The research project is developing a scalable, cost effective, reconfigurable fiber sensor array for large sub-surface monitoring of CO₂. This technology contributes to the Carbon Storage Program's effort to ensure 99% CO₂ storage permanence in the injection zones.

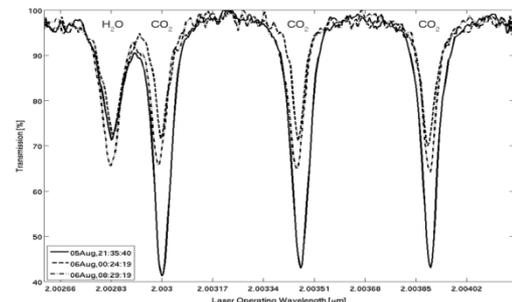

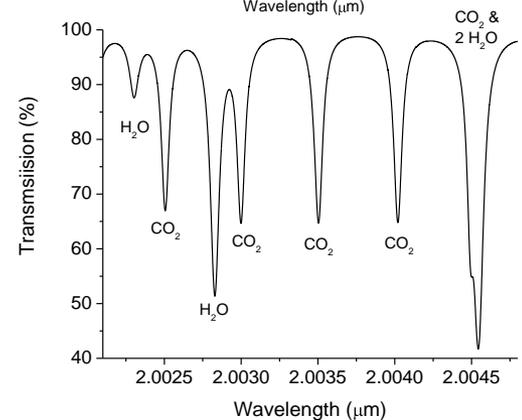

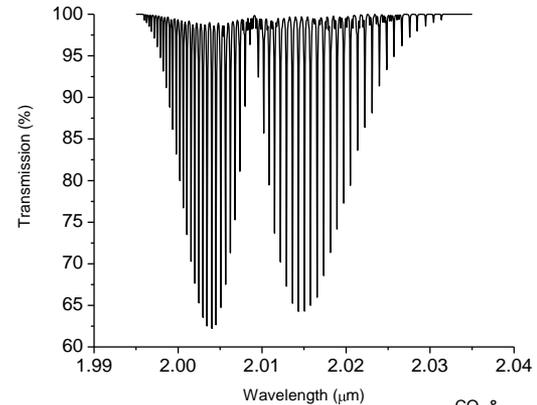

Project Overview: Goals and Objectives

- The project objectives for the proposed work include the development, testing, and deployment of a 1 x N fiber sensor array for subsurface CO₂ monitoring.
 - Relates to the development of technologies to demonstrate that 99% of CO₂ remains in the injected zones.
 - Success criteria: Demonstration of instrument from a laboratory setting.
- Testing of the instrument will be conducted to determine the performance of the fiber sensor array at the Zero Emission Research Technology (ZERT) field site during a controlled release experiment.
 - Relates to conducting field tests for site operations.
 - Success criteria: Demonstration of instrument during a ZERT controlled release experiment.

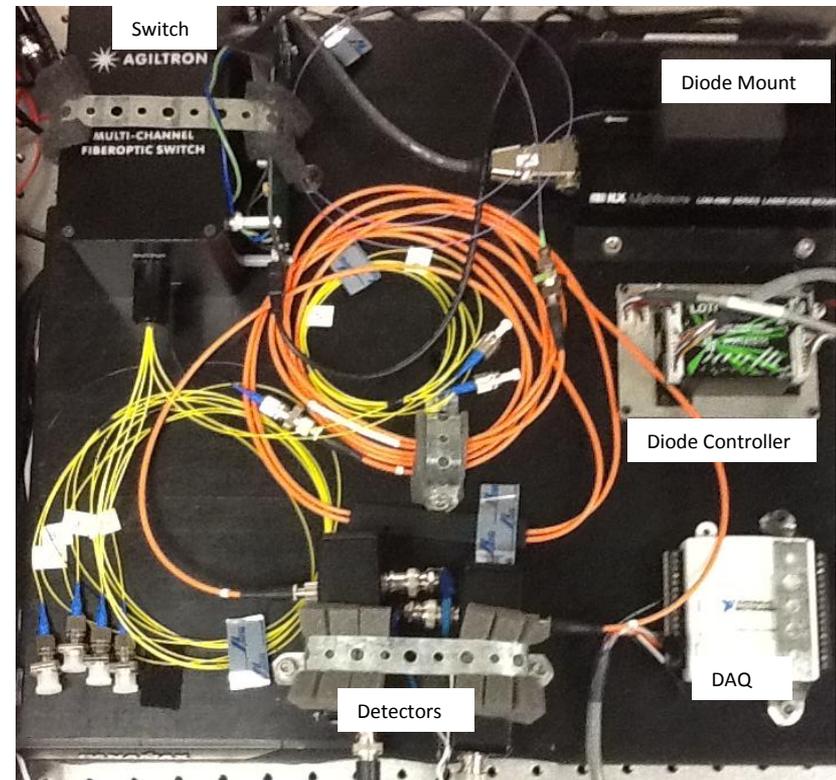

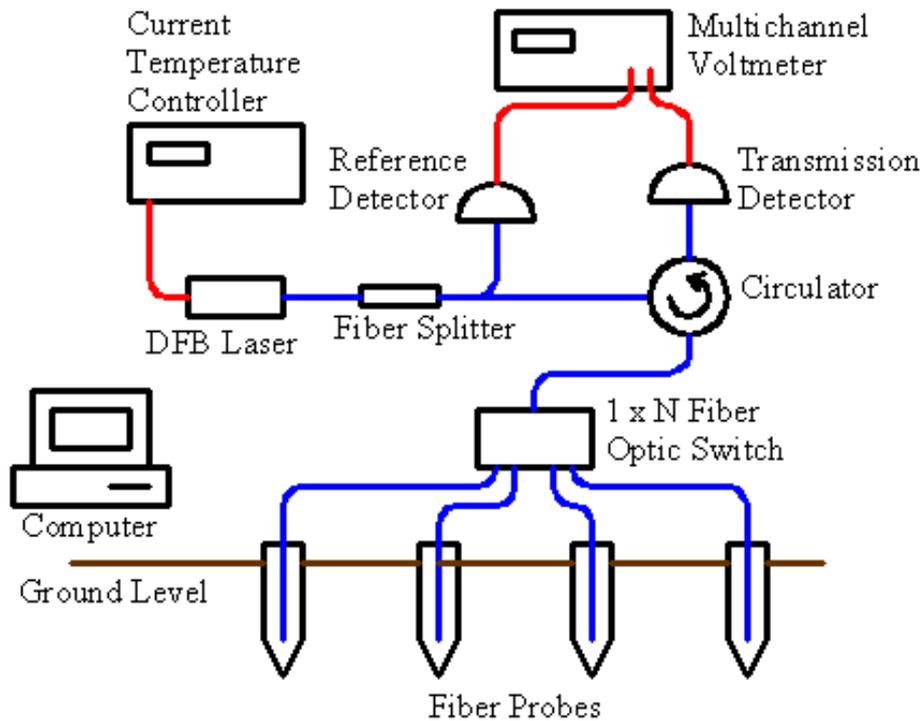

Technical Status: Integrated Path Differential Absorption (IPDA) Technique

- The number density for carbon dioxide is related to the amount of light absorbed as a function of wavelength.
- Working near the 2 μm wavelength provides strong absorption features which allow subsurface CO_2 concentration measurements to be made in as little as 0.5 m.
- Measuring the normalized transmission allows on to calculate the number density.
- Using the line strength and line shape parameters, the concentration can be calculated from the IPDA equation:

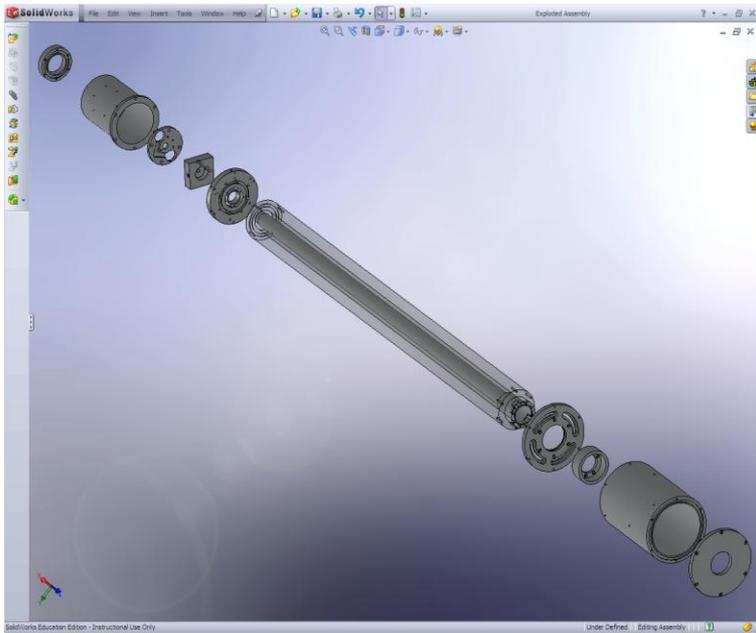

$$C = \frac{-\ln(T)}{Sg(\nu - \nu_0) N_L (296 / T_a) P_T L},$$

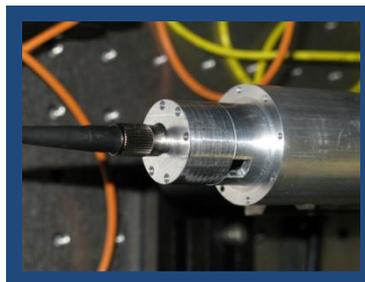

Technical Status: Instrument Design

Technical Status: Probes

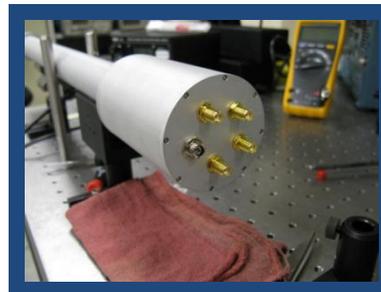

Solidworks CAD drawing of the probe design. The probe was designed to contain all passive optical components and is inexpensive to manufacture.

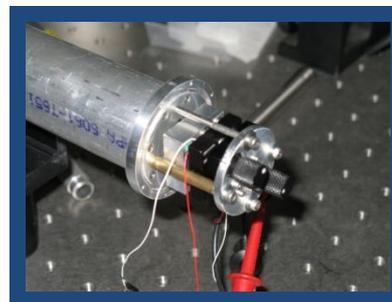

Fiber coupler details

Electronic Feed-through

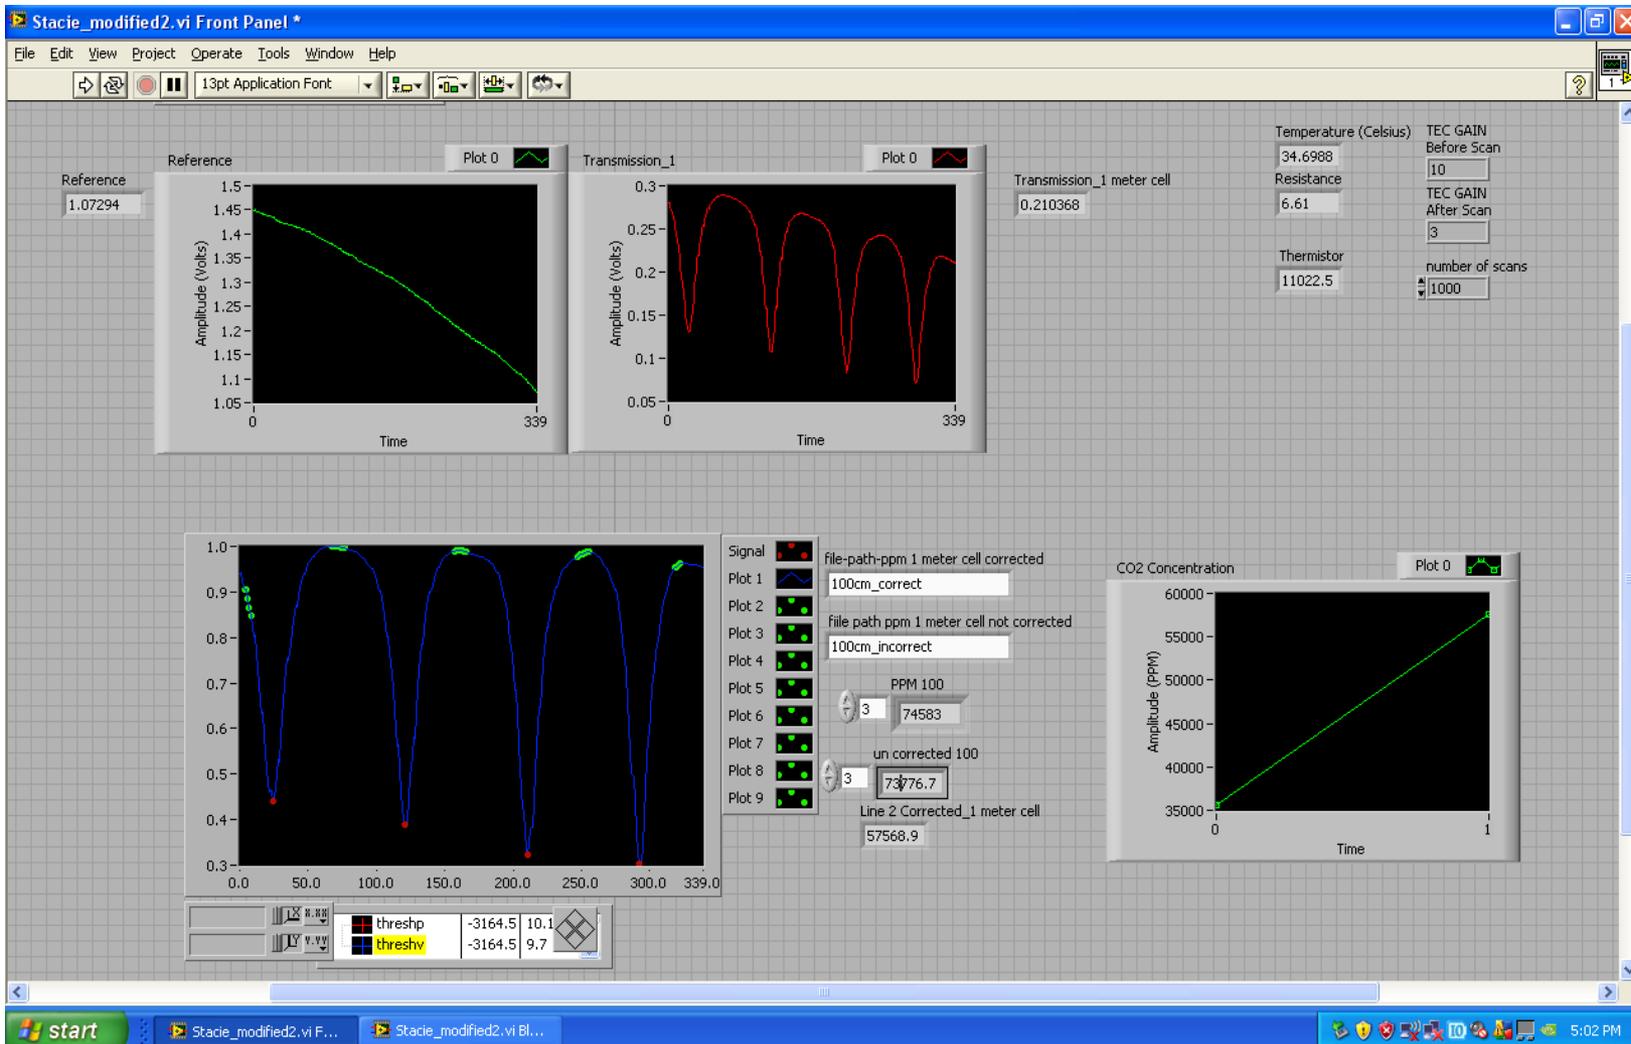

Gas permeable membrane

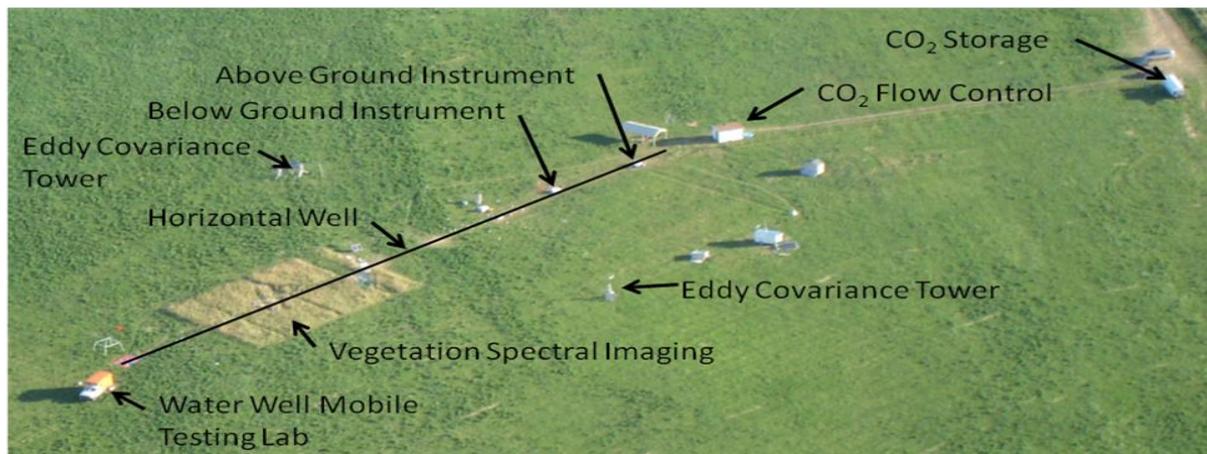

Retro-reflector details

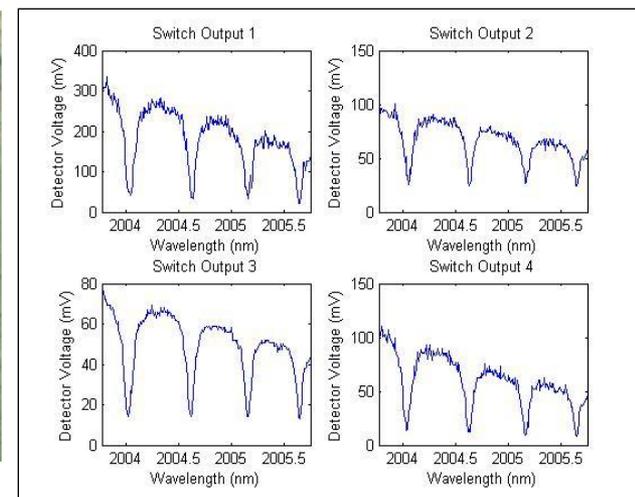

Four completed fiber probes

Technical Status: Field Experiment

Aerial view of the ZERT controlled release site.

Transmission data from the four probes (un-normalized).

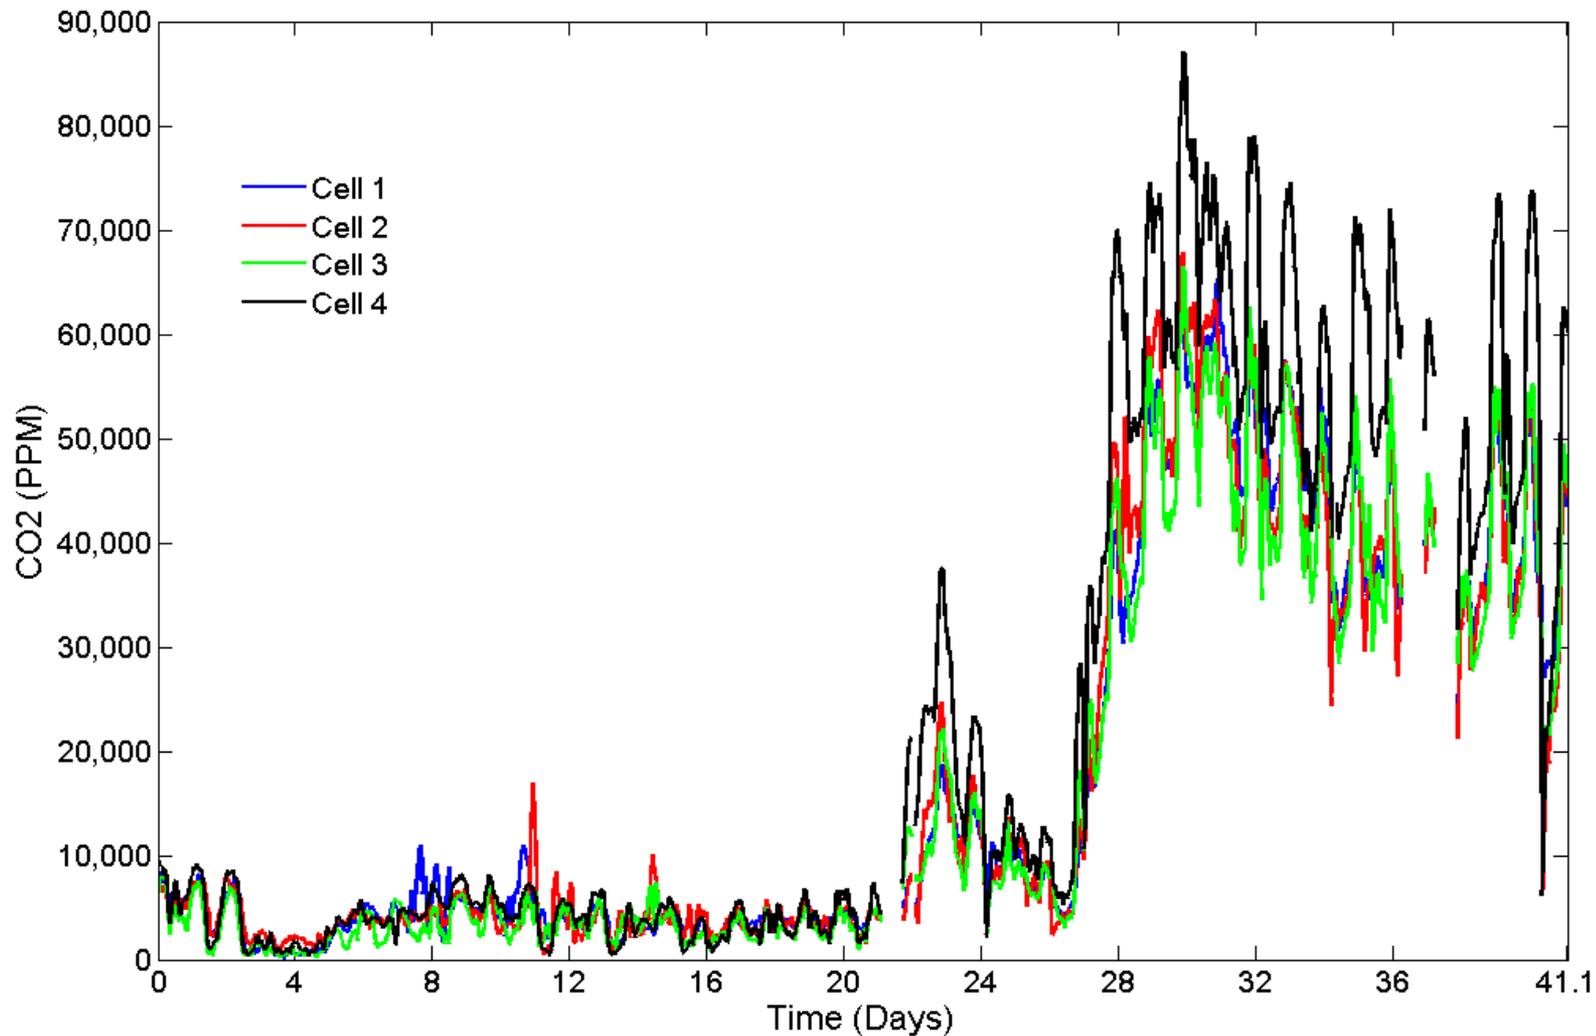

Electronics and optics packaged in a weatherproof enclosure for field studies.

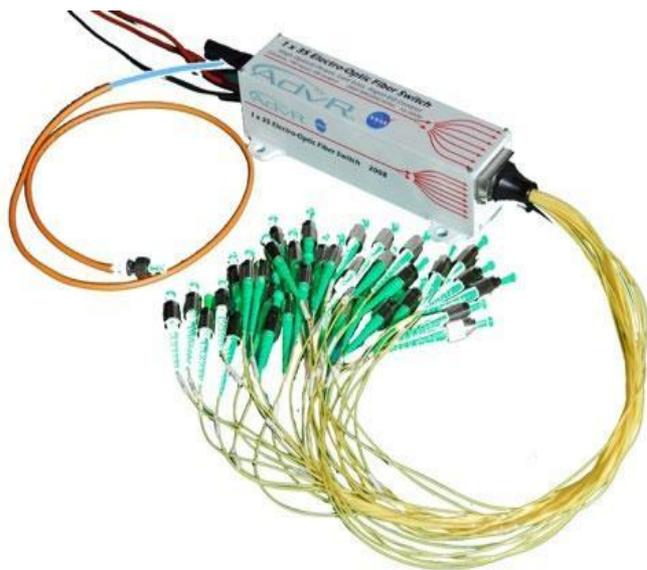

Instrument deployed at the ZERT site with sun shade.

Technical Status: ZERT Field Data

Scalability and Large Area Coverage

A commercial 1 x 100 fiber optic switch allows up to 100 probes to be deployed. Using standard telecommunications fiber, these 100 probes can be located up to 1 km away from the central electronics box.

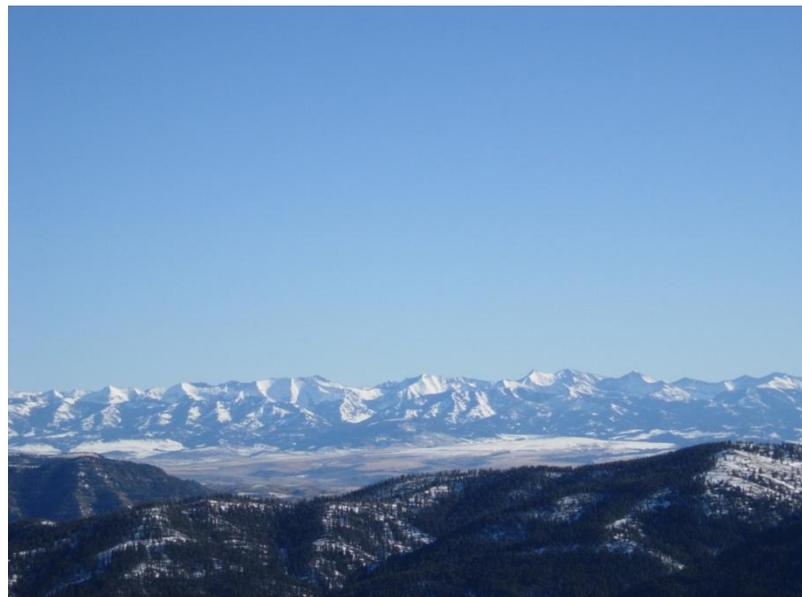

Because the cost of the probes is kept low, scaling to 100 probes will not greatly increase the cost providing a cost effective sensor array.

- A 1 X N fiber sensor array architecture has been developed.
- Subsurface CO₂ concentration measurements have been made continuously for over 40 days.
- Instrument has been demonstrated at the ZERT field site where the elevated subsurface CO₂ concentration from the subsurface release is clearly evident.

Summary

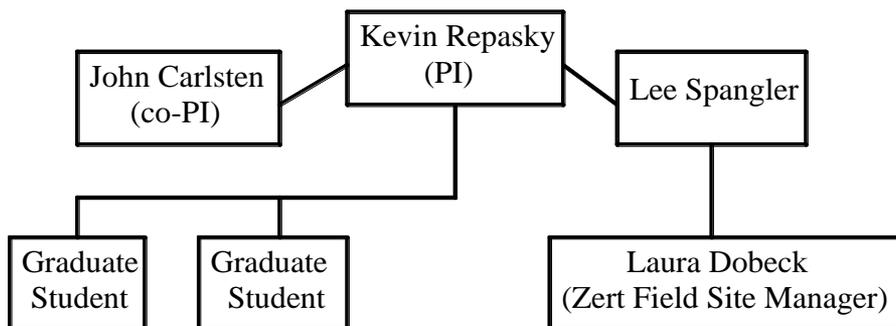

- The fiber sensor array has been successfully deployed at the ZERT controlled release experiment.
- The fiber sensor array offers a scalable, reconfigurable, cost effective monitor for large area coverage with autonomous operations.
- Future Plans
 - Include a second DFB laser for sensing oxygen to provide the potential to distinguish sources of subsurface CO₂.
 - Working with Advr and starting discussions with Lambda Inc. to transfer technology into the commercial market.

Thanks Kindly for Your Time

Appendix: Organization Chart

Organizational Chart

- Kevin Repasky: (PI) responsible for overall project.

John Carlsten: (Co-PI) work with Dr. repasky to manage project and students.

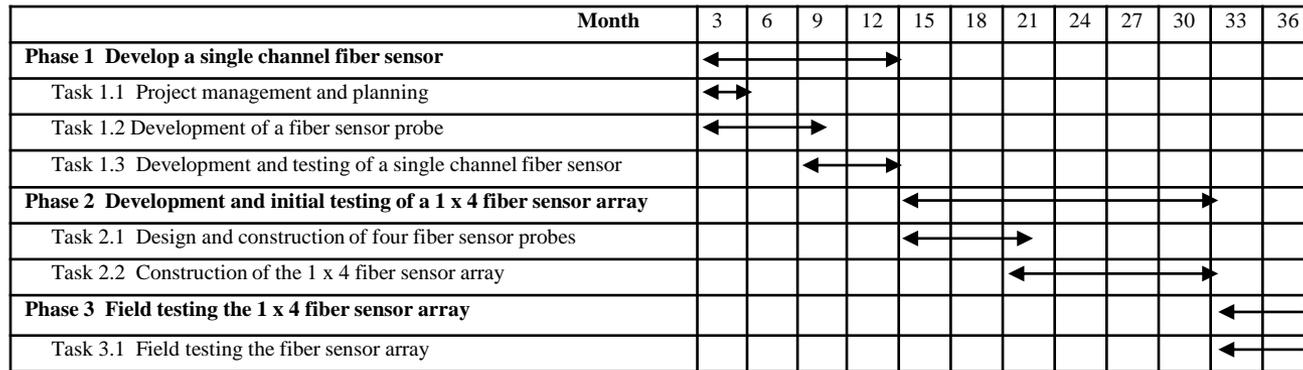

Lee Spangler: Head of ZERT and BSCSP.

Coordinate field work

Laura Dobeck:

Coordinate ZERT field experiments.

Appendix: Gantt Chart

Appendix: Presentations and Publications

- Presentations:
 - “Large area detection of CO₂ for carbon sequestration”, IEAGHG: Environmental Impacts of CO₂ Storage Workshop, Bozeman, MT, July 2012 (invited).
 - “Subterranean Carbon Dioxide (CO₂) Concentration Analysis Utilizing an Optical Fiber Probe Array for Carbon Capture and Storage (CCS) Site Monitoring”, Benjamin Soukup, Kevin S. Repasky, and John L. Carlsten, American Geophysical Union, San Francisco, California, 2011.
 - “Sub-Surface Carbon Dioxide Concentration Measurement Using a Fiber Based Sensor in a Send/Call Geometry for Carbon Sequestration Site Monitoring”, Geoffrey Wicks, Benjamin Soukup, Kevin S. Repasky, John L. Carlsten, Jamie L. Barr, and Laura Dobeck, American Geophysical Union Meeting, San Francisco, California, 2010.
- Papers:
 - “Development of a 1 X N fiber sensor array for subsurface carbon sequestration site monitoring”, Benjamin Soukup, Geoffrey Wicks, Kevin S. Repasky, and John L. Carlsten, in preparation for submission to the Journal of Applied Remote Sensing.
