

Crosscutting Research

Session A8: Monitoring and Controls

April 11, 2019

Advanced Controls and System Identification

David Tucker, NETL
Farida Harun, NETL
Larry Shadle, NETL
Nana Zhou, NETL
Dan Maloney, NETL
Dan Oryshchyn, NETL
Natarianto Indrawan, NETL
Hao Chen, NETL (Chongqing)

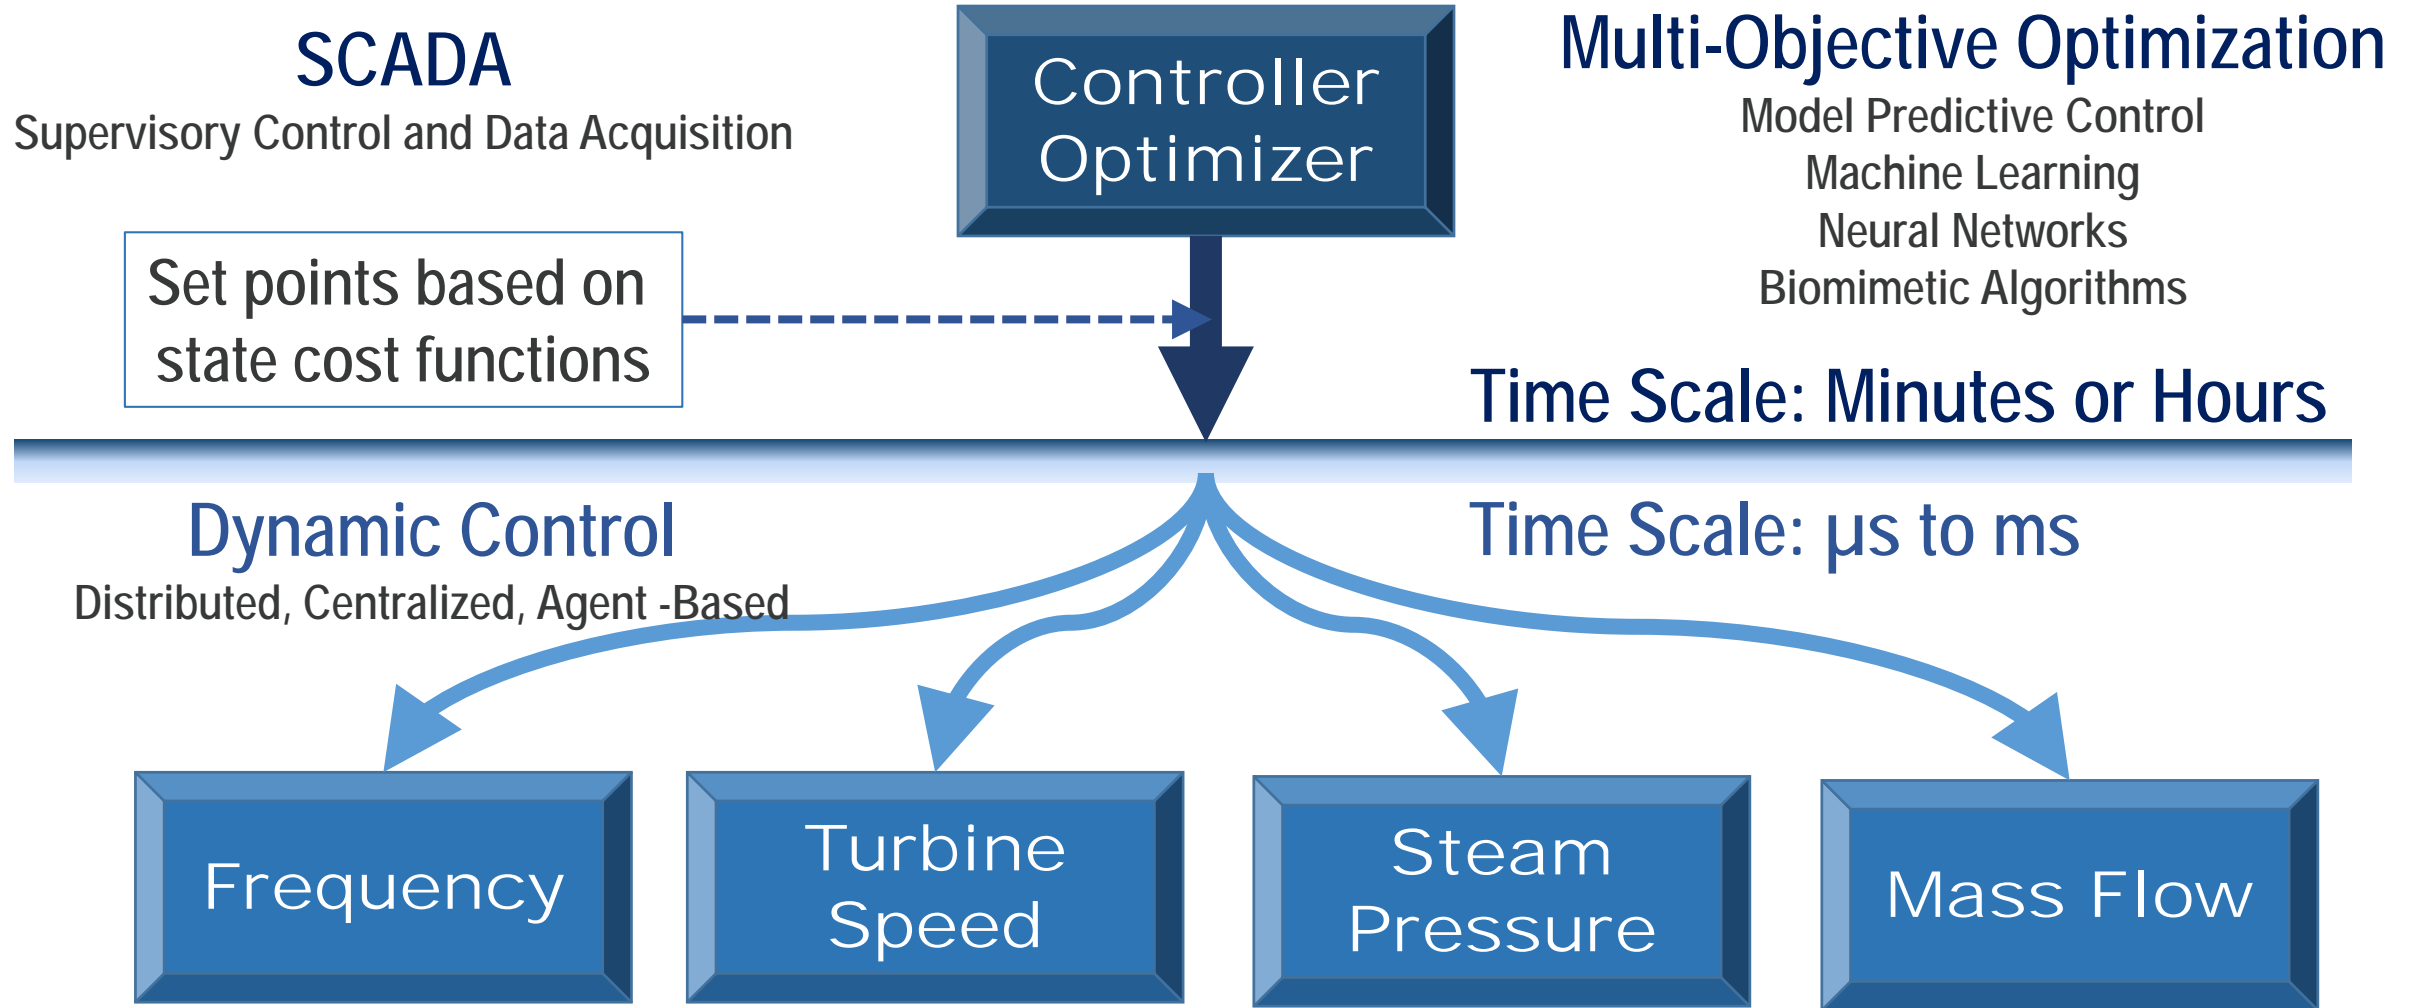

Mark Bryden, Ames Laboratory
Paolo Pezzini, Ames Laboratory
Harry Bonilla, Ames Laboratory
Peter Finzel, Ames Laboratory

Comas Haynes, Georgia Tech
José Colon, Georgia Tech
Jesus Arias, Georgia Tech

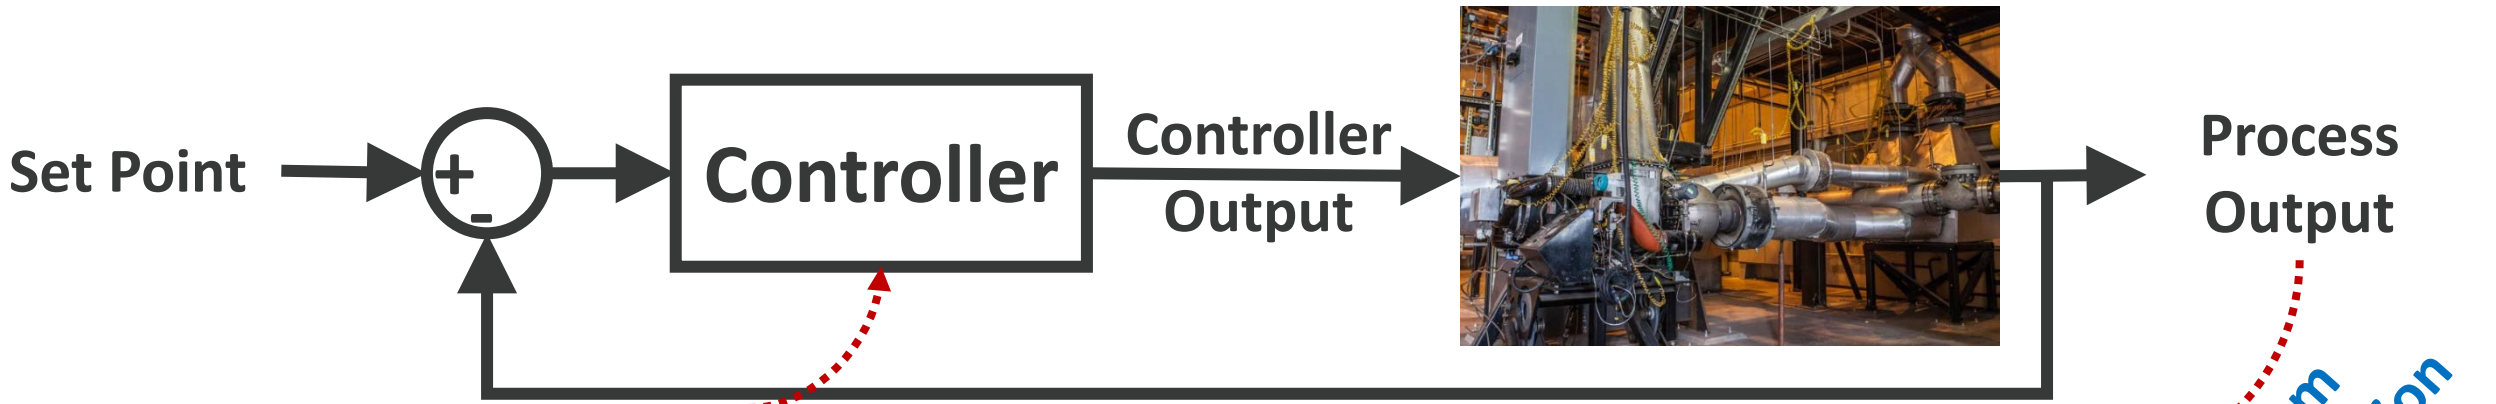

Hyper Gang

Controls, Models, and System Identification

Dynamic Control (Distributed PID)

Stable at a single operating state

Gain Tuning

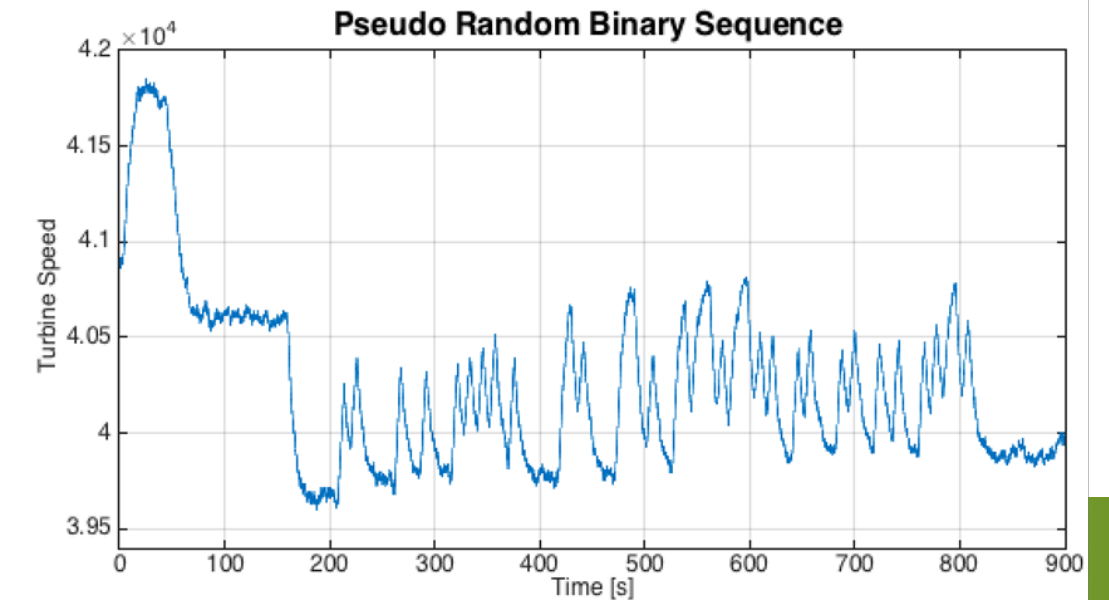

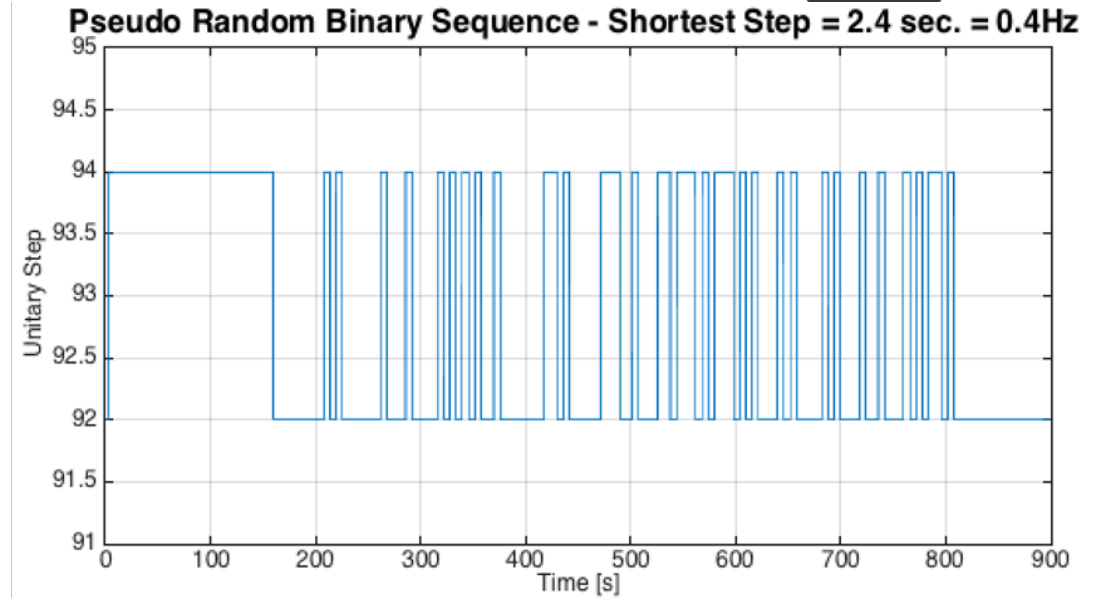

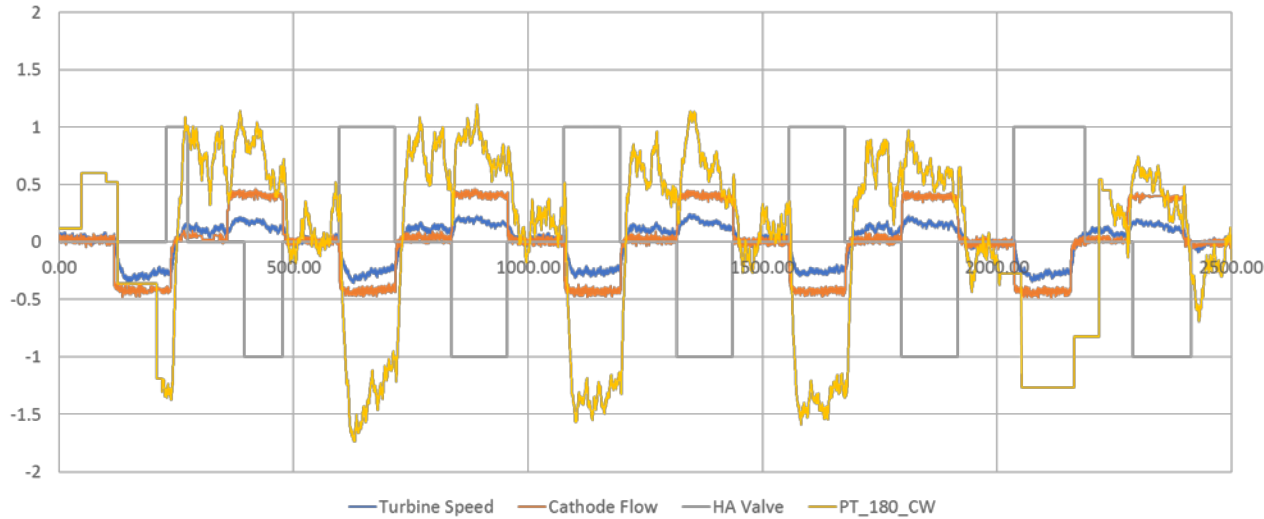

1st Order
Higher Order
Linear

$$\frac{\omega_n^2}{s^2 + 2\zeta\omega_n s + \omega_n^2}$$

(Transfer function model)

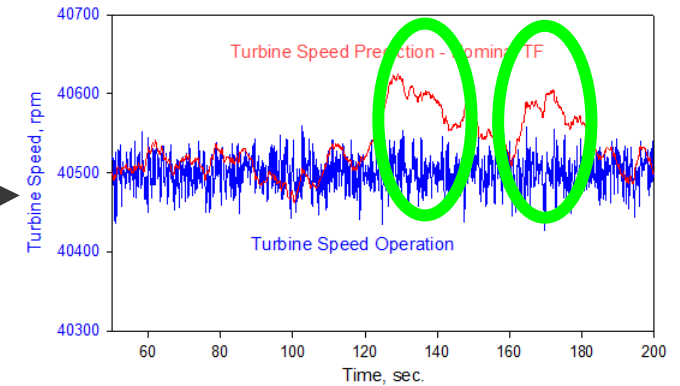

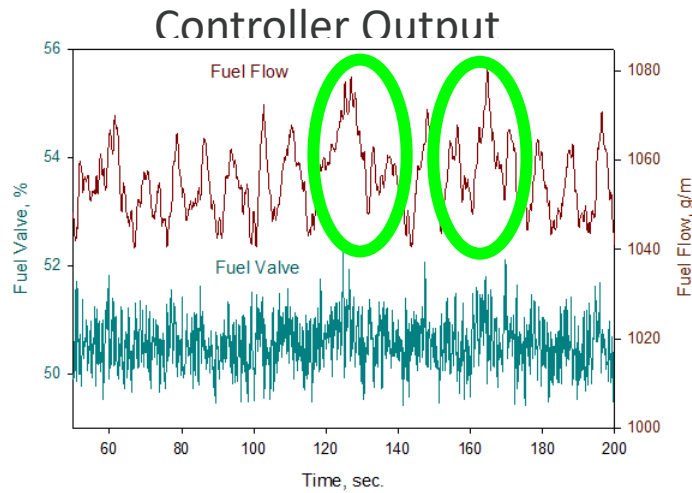

System Identification

Online System Identification

Diagnostics

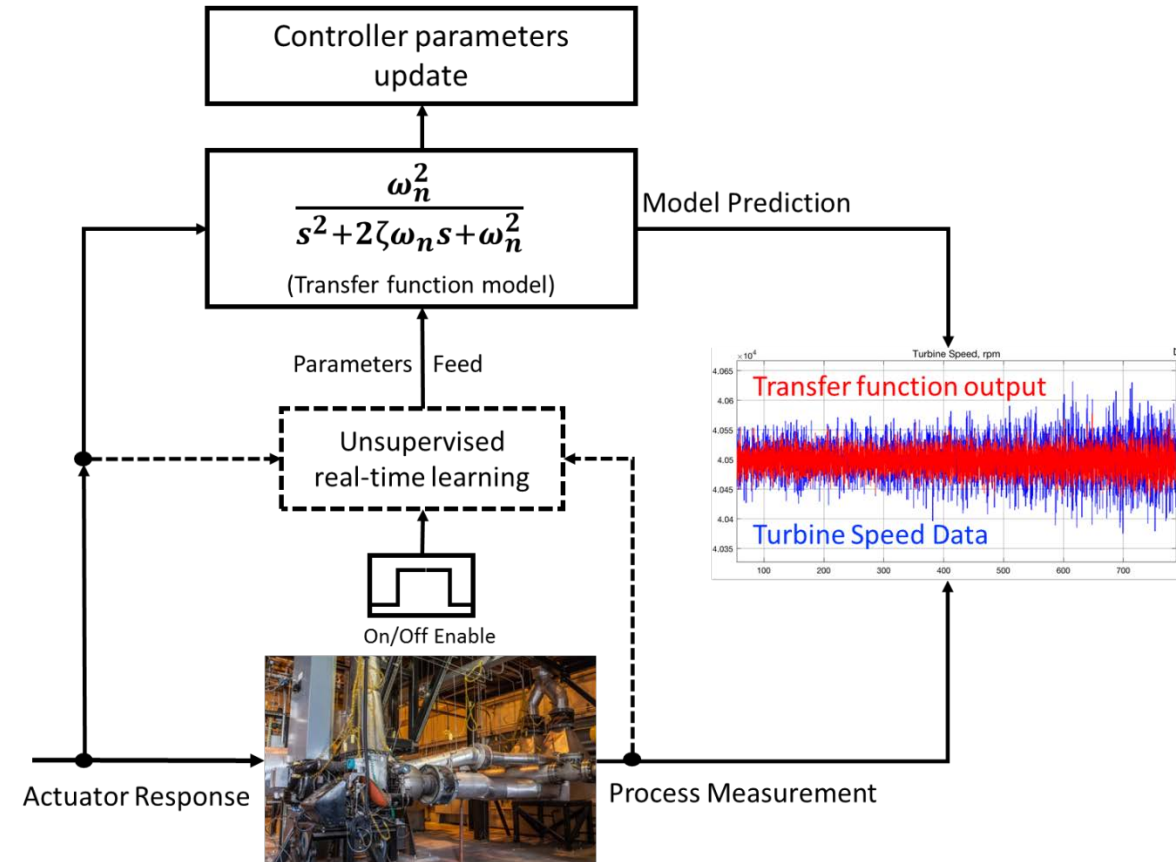

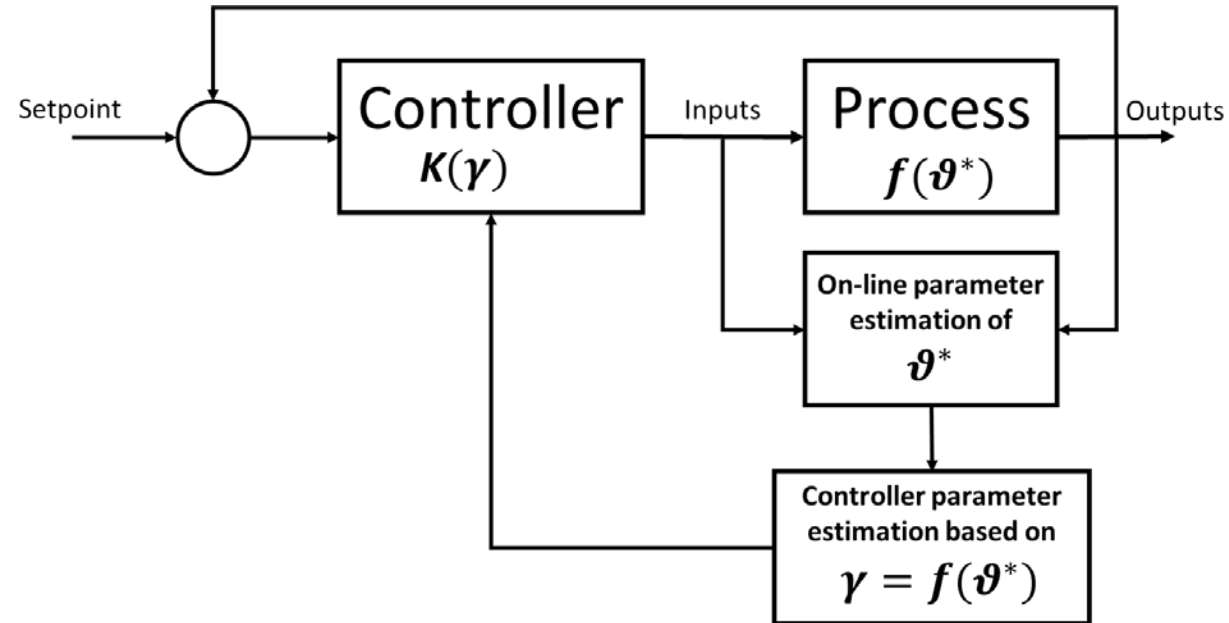

Set Point

Transfer function at nominal condition

Continuously Adaptive Gain Scheduling

Online System Identification

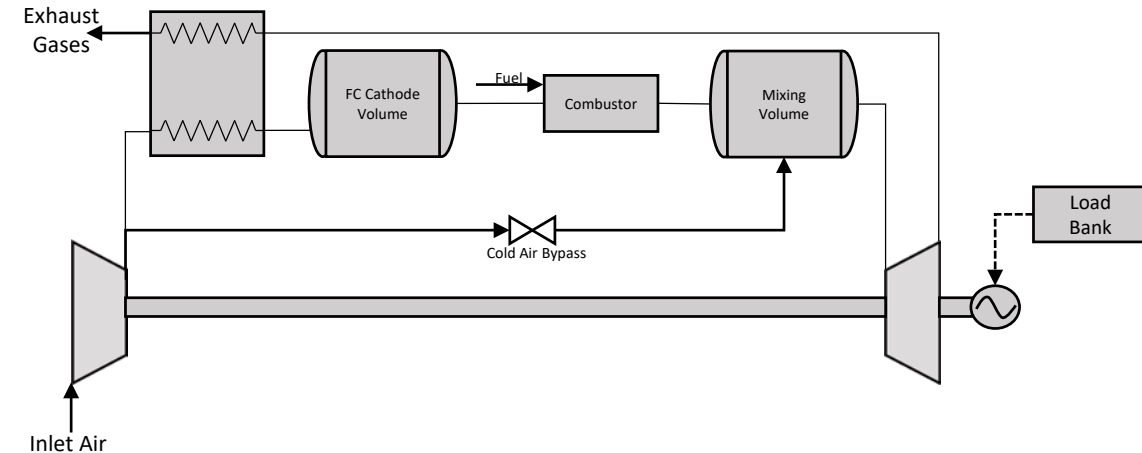

Continuously Adaptive Gain Scheduling

Coupling and Non-Linear Interactions

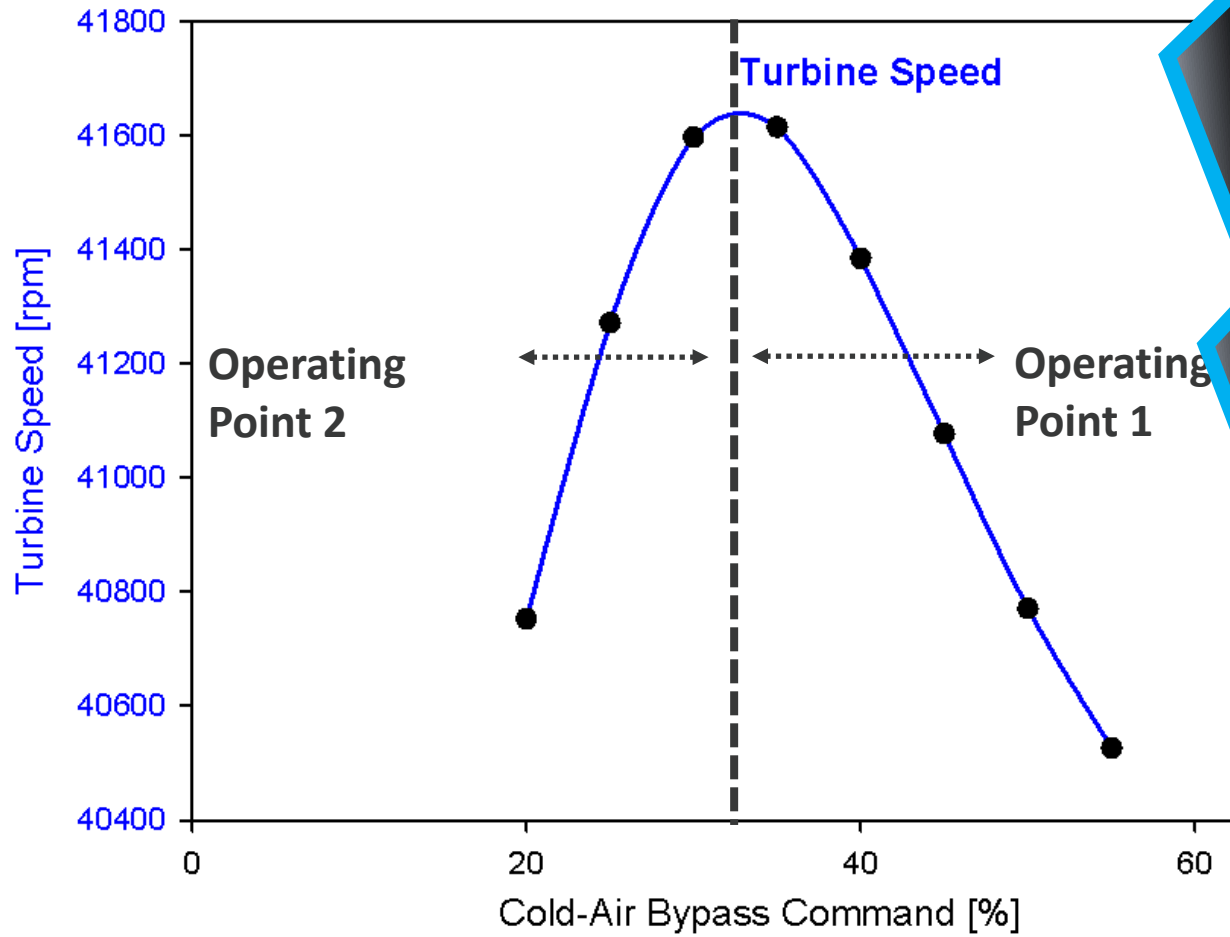

Non-Linear System Identification with Gain Scheduling

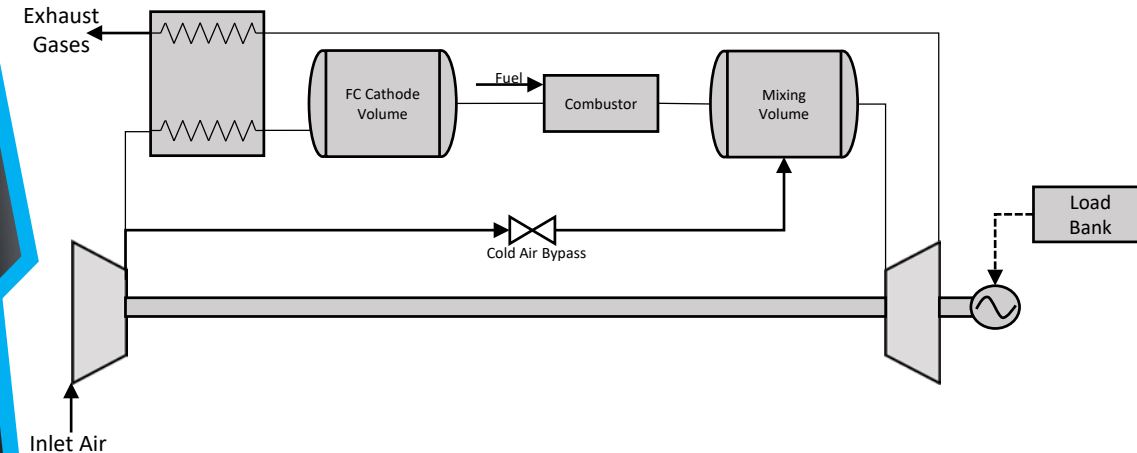

But...

Approach for Highly Coupled Systems

Physical Decoupling of the Process

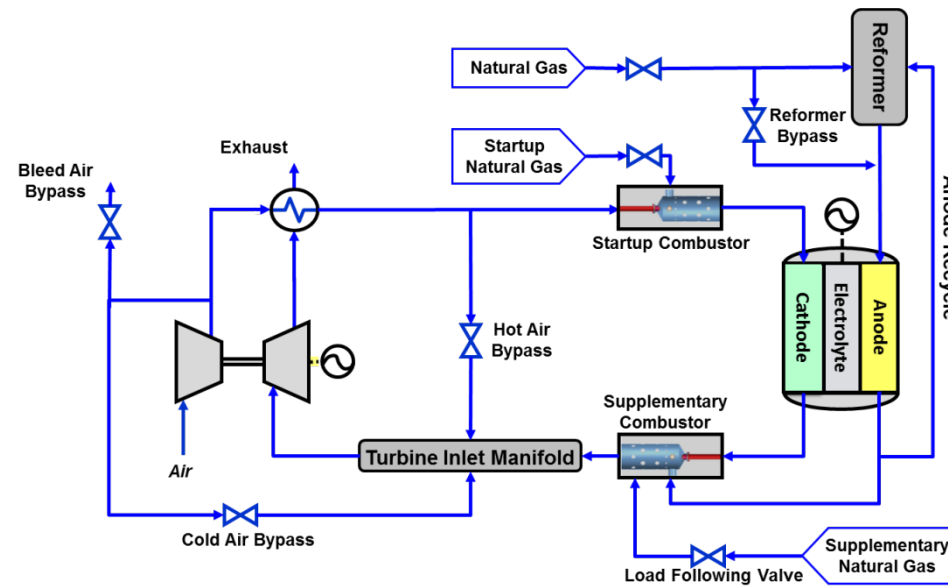

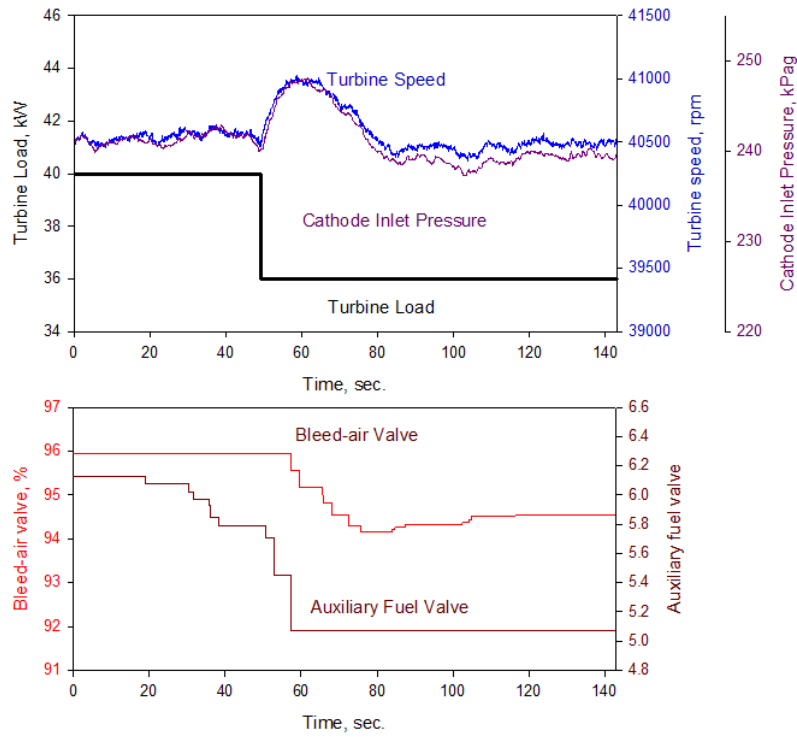

Current Paradigm for Technology Development

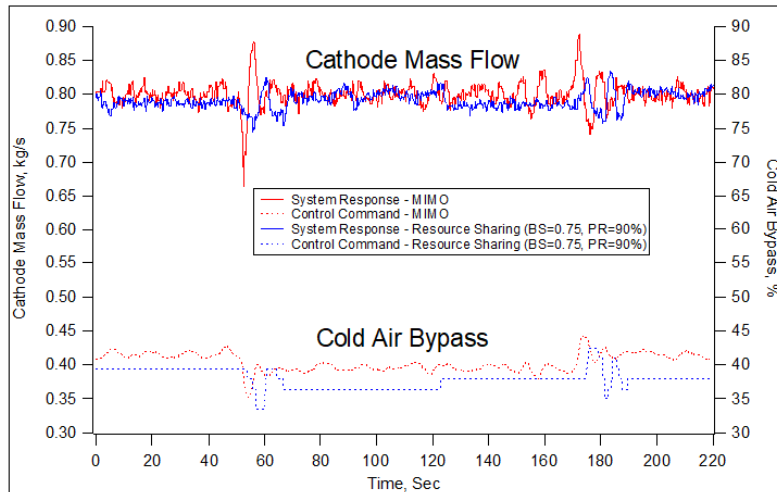

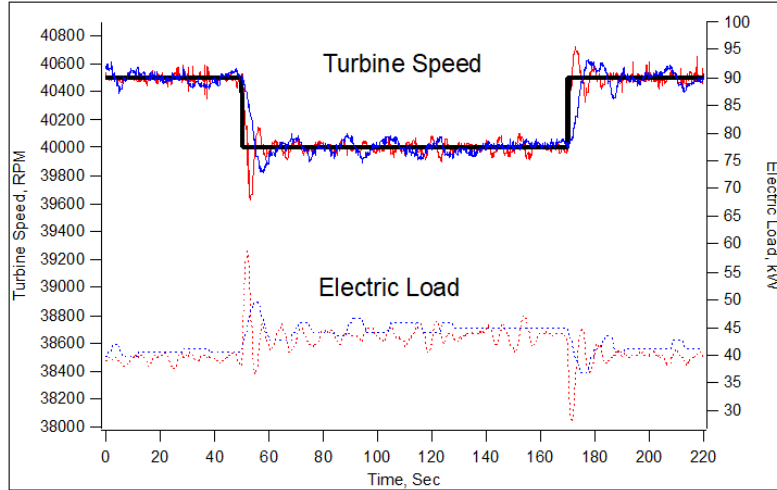

Model-Free Control (Agent-Based)

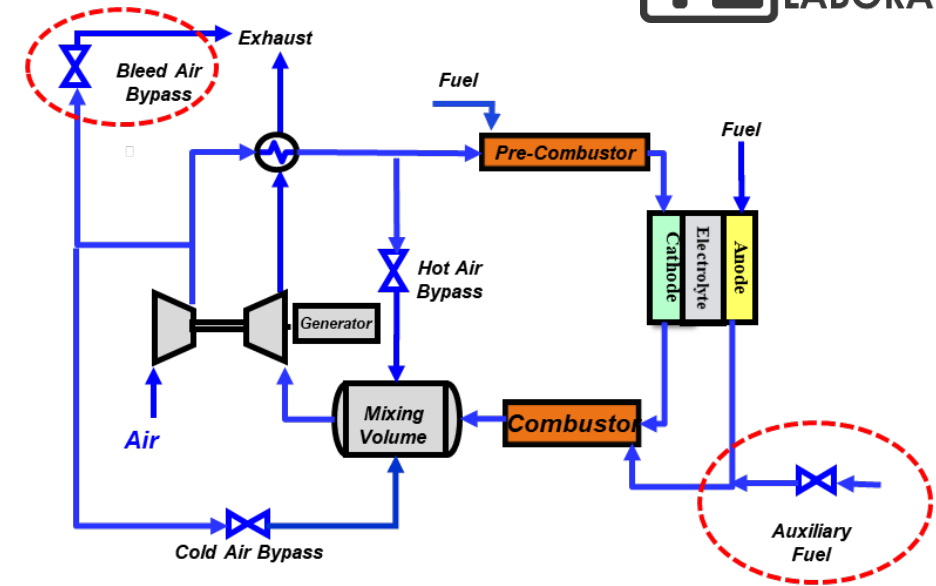

- Model-free design
- Reconfigurable on different power plants
- Multi-agents emulate intelligent control
- Agents can coordinate their behavior

Airflow and Turbine Speed Control

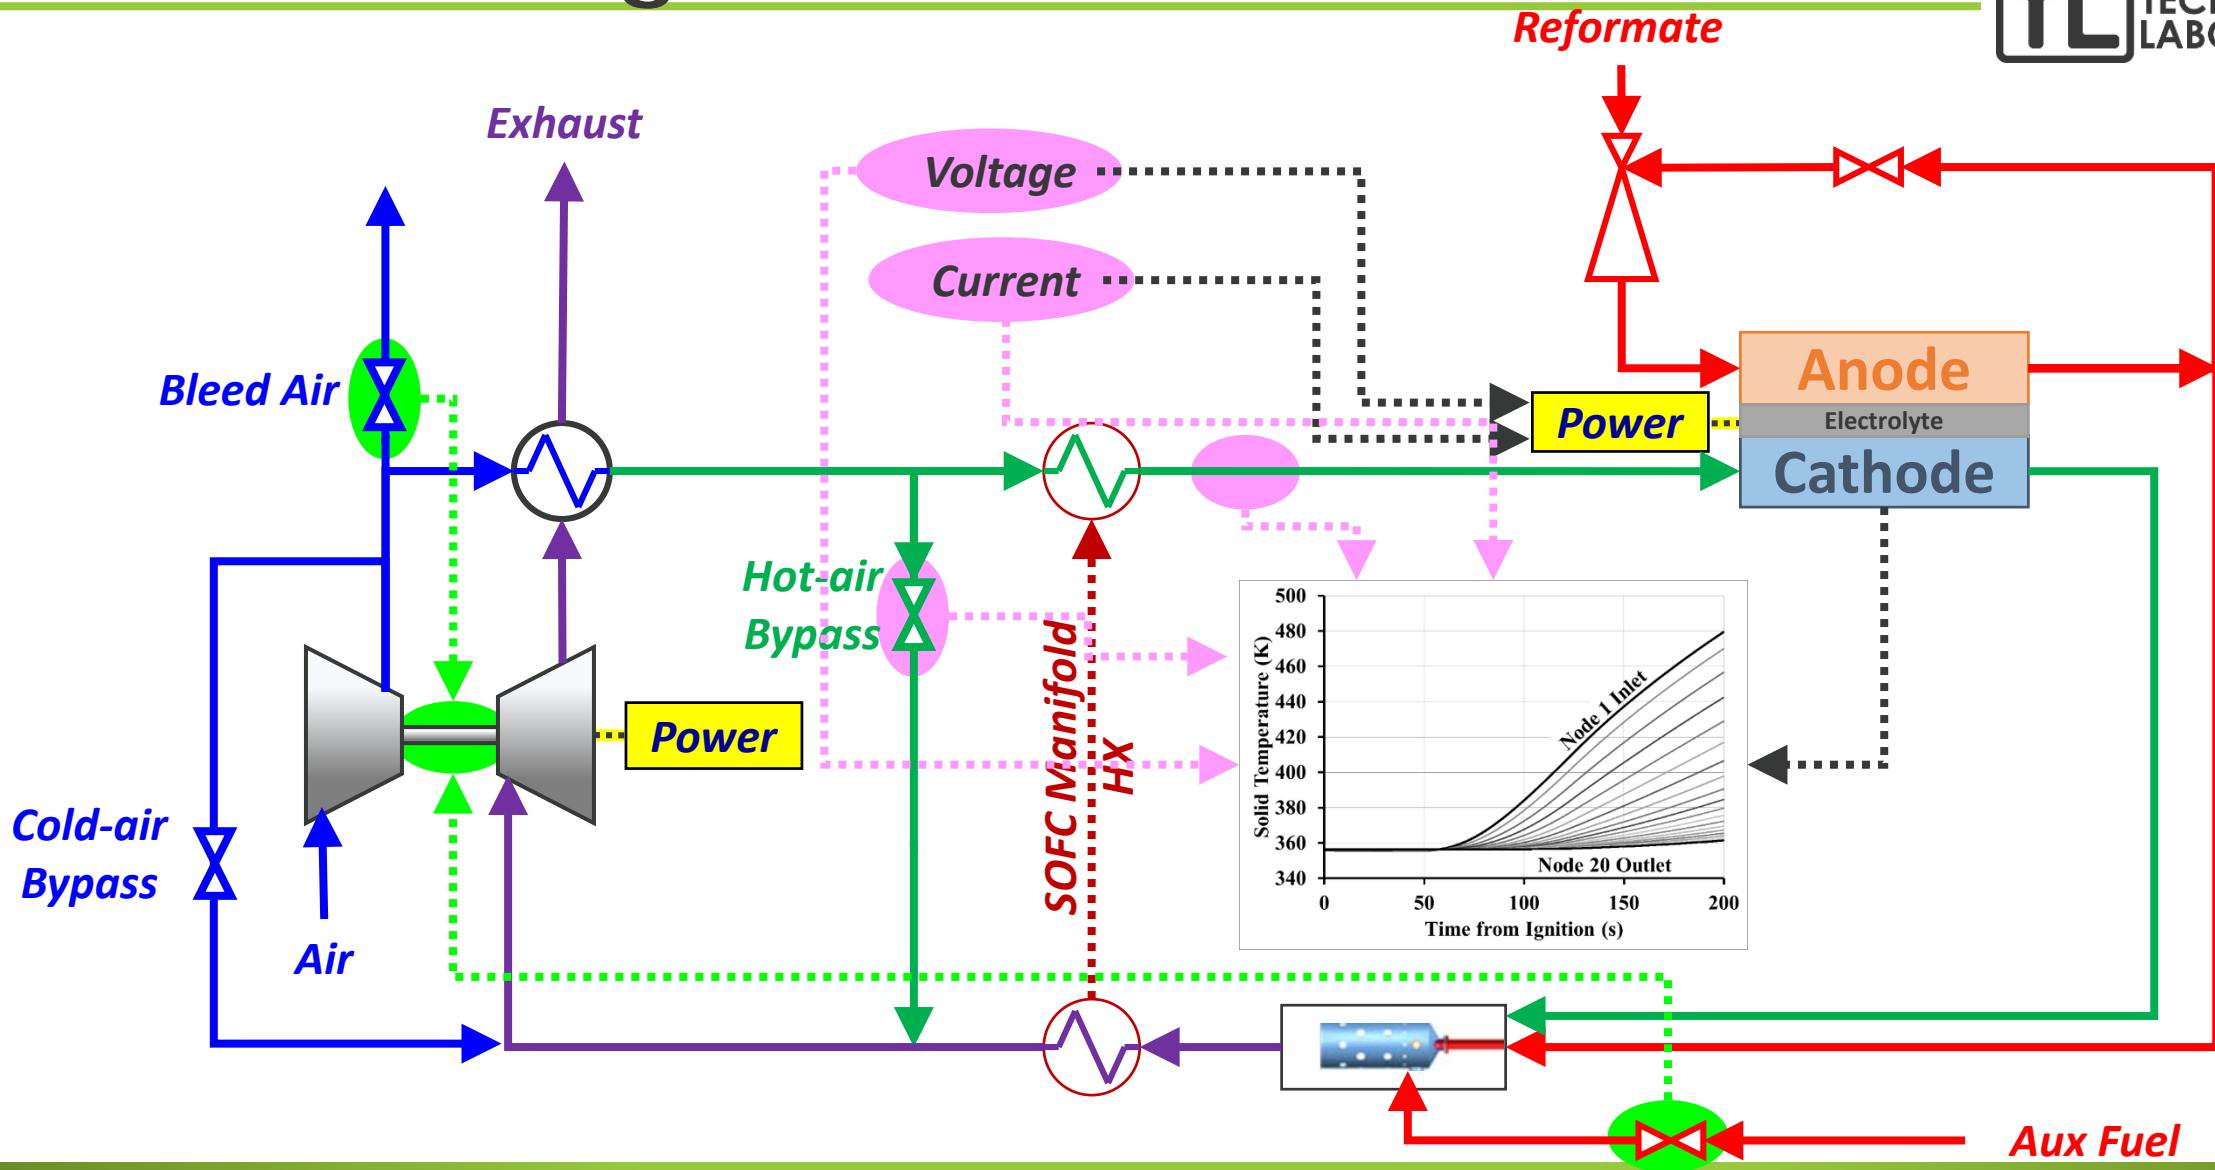

Load Following Control

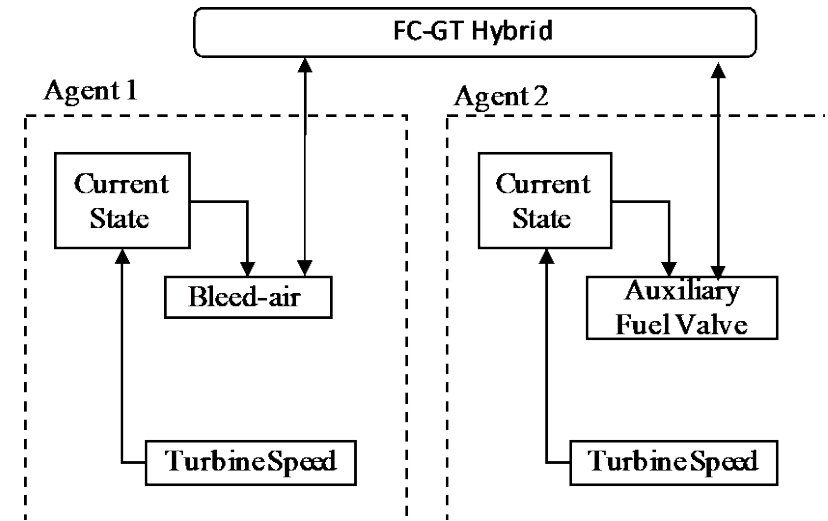

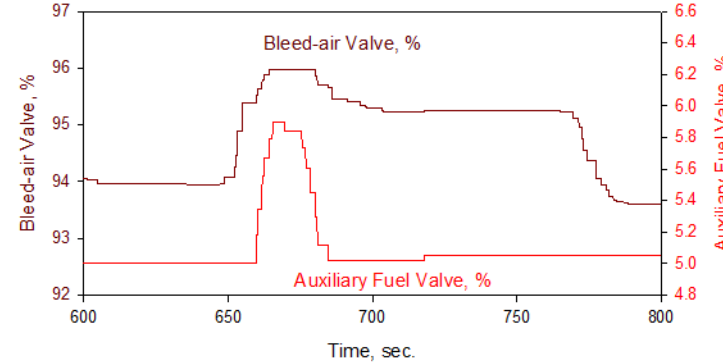

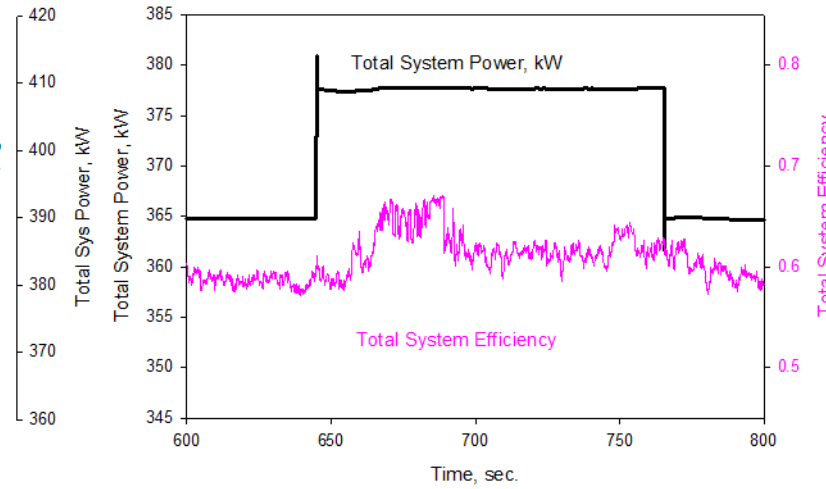

Nominal condition:

- Fuel cell thermal heat drives the gas turbine
- Closed valves position to maximize system efficiency
- Valve opening during transient operation

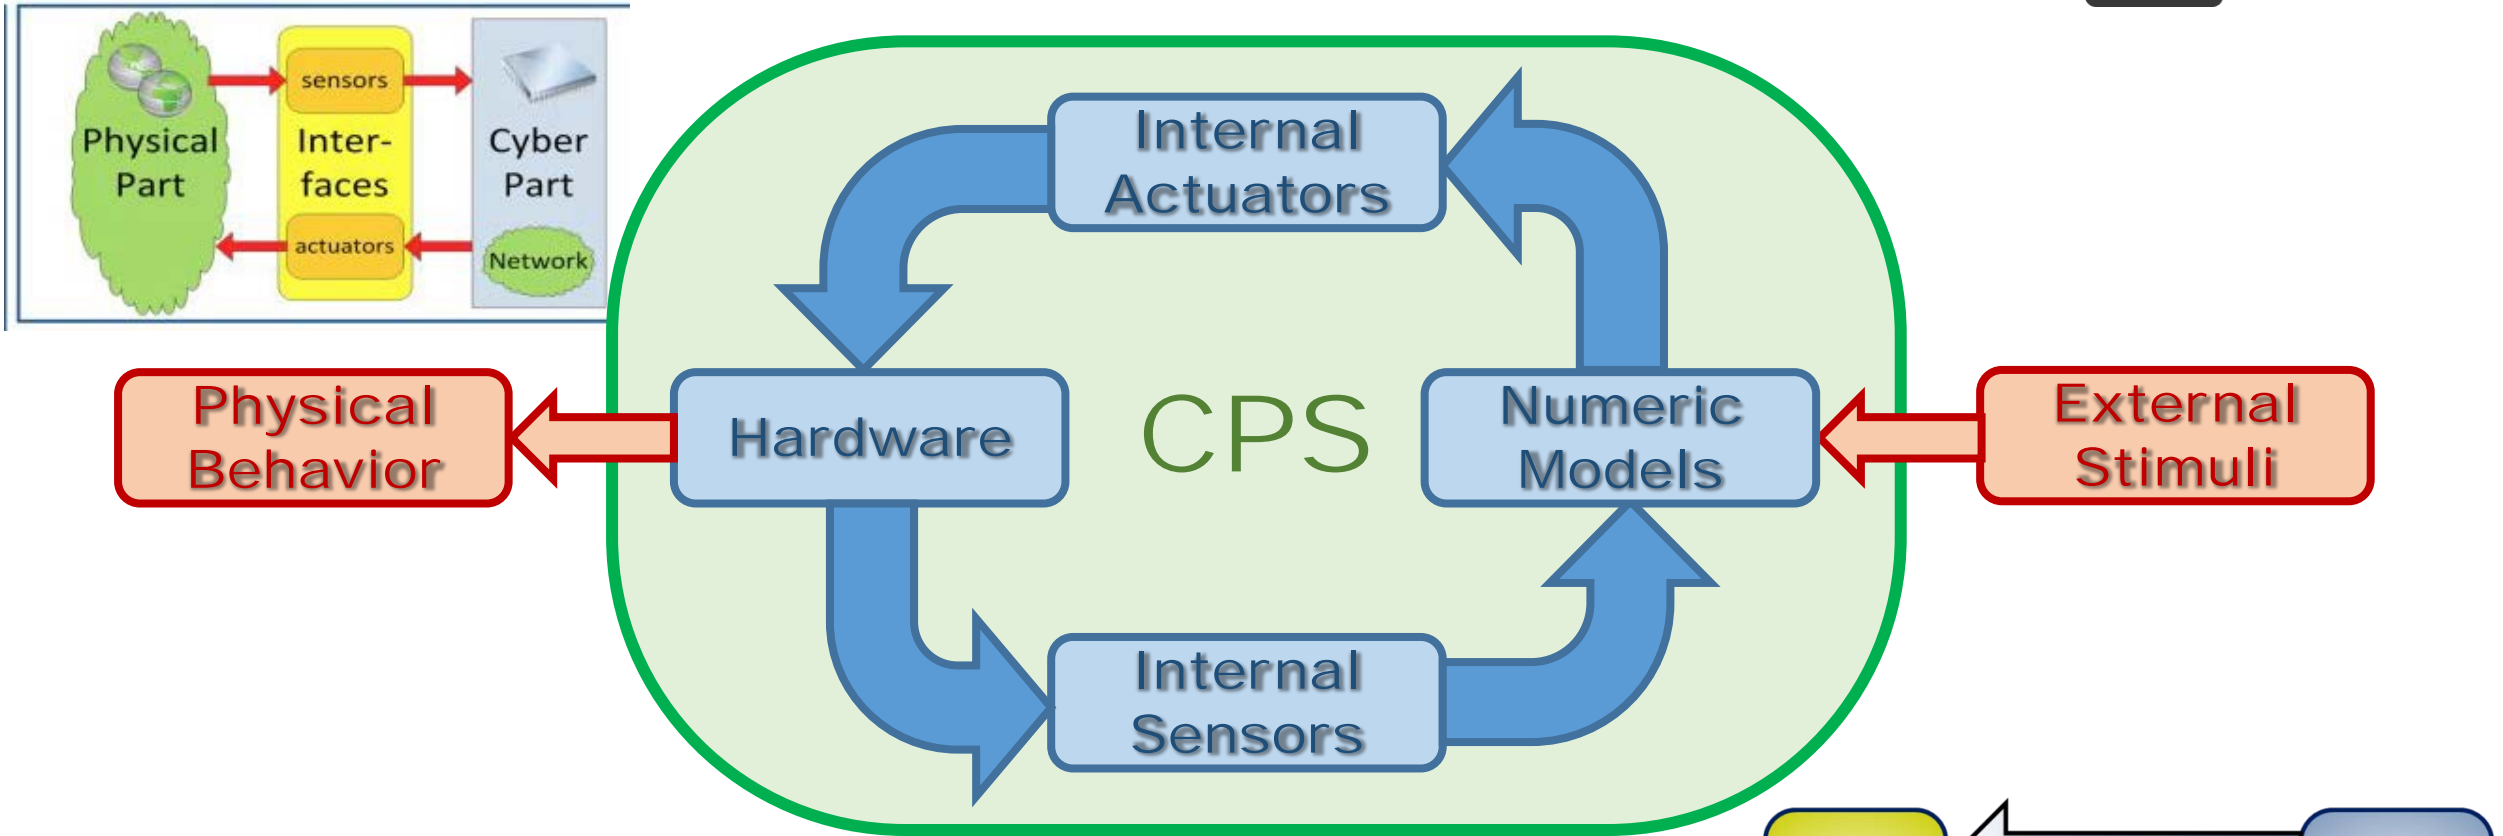

Load Following Control

Load Following Control

Cyber-Physical Systems

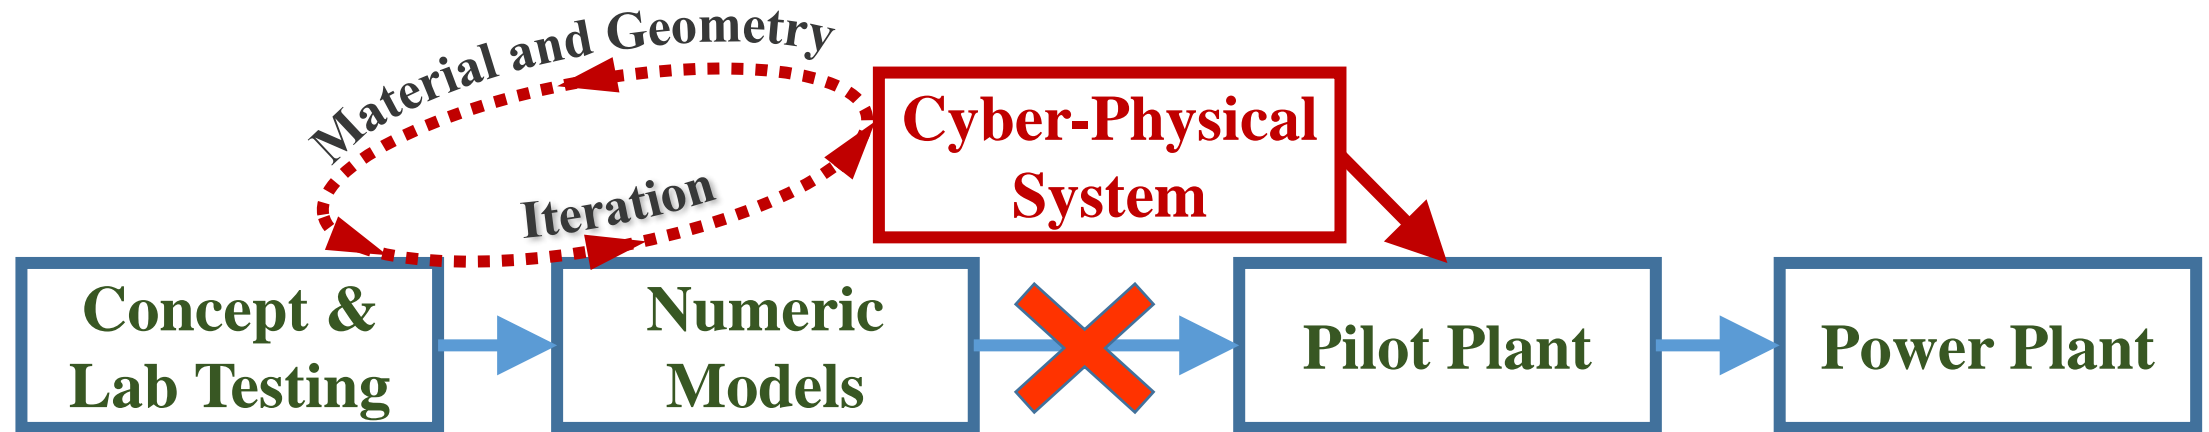

Cyber Physical Systems are used to replace physical systems that:

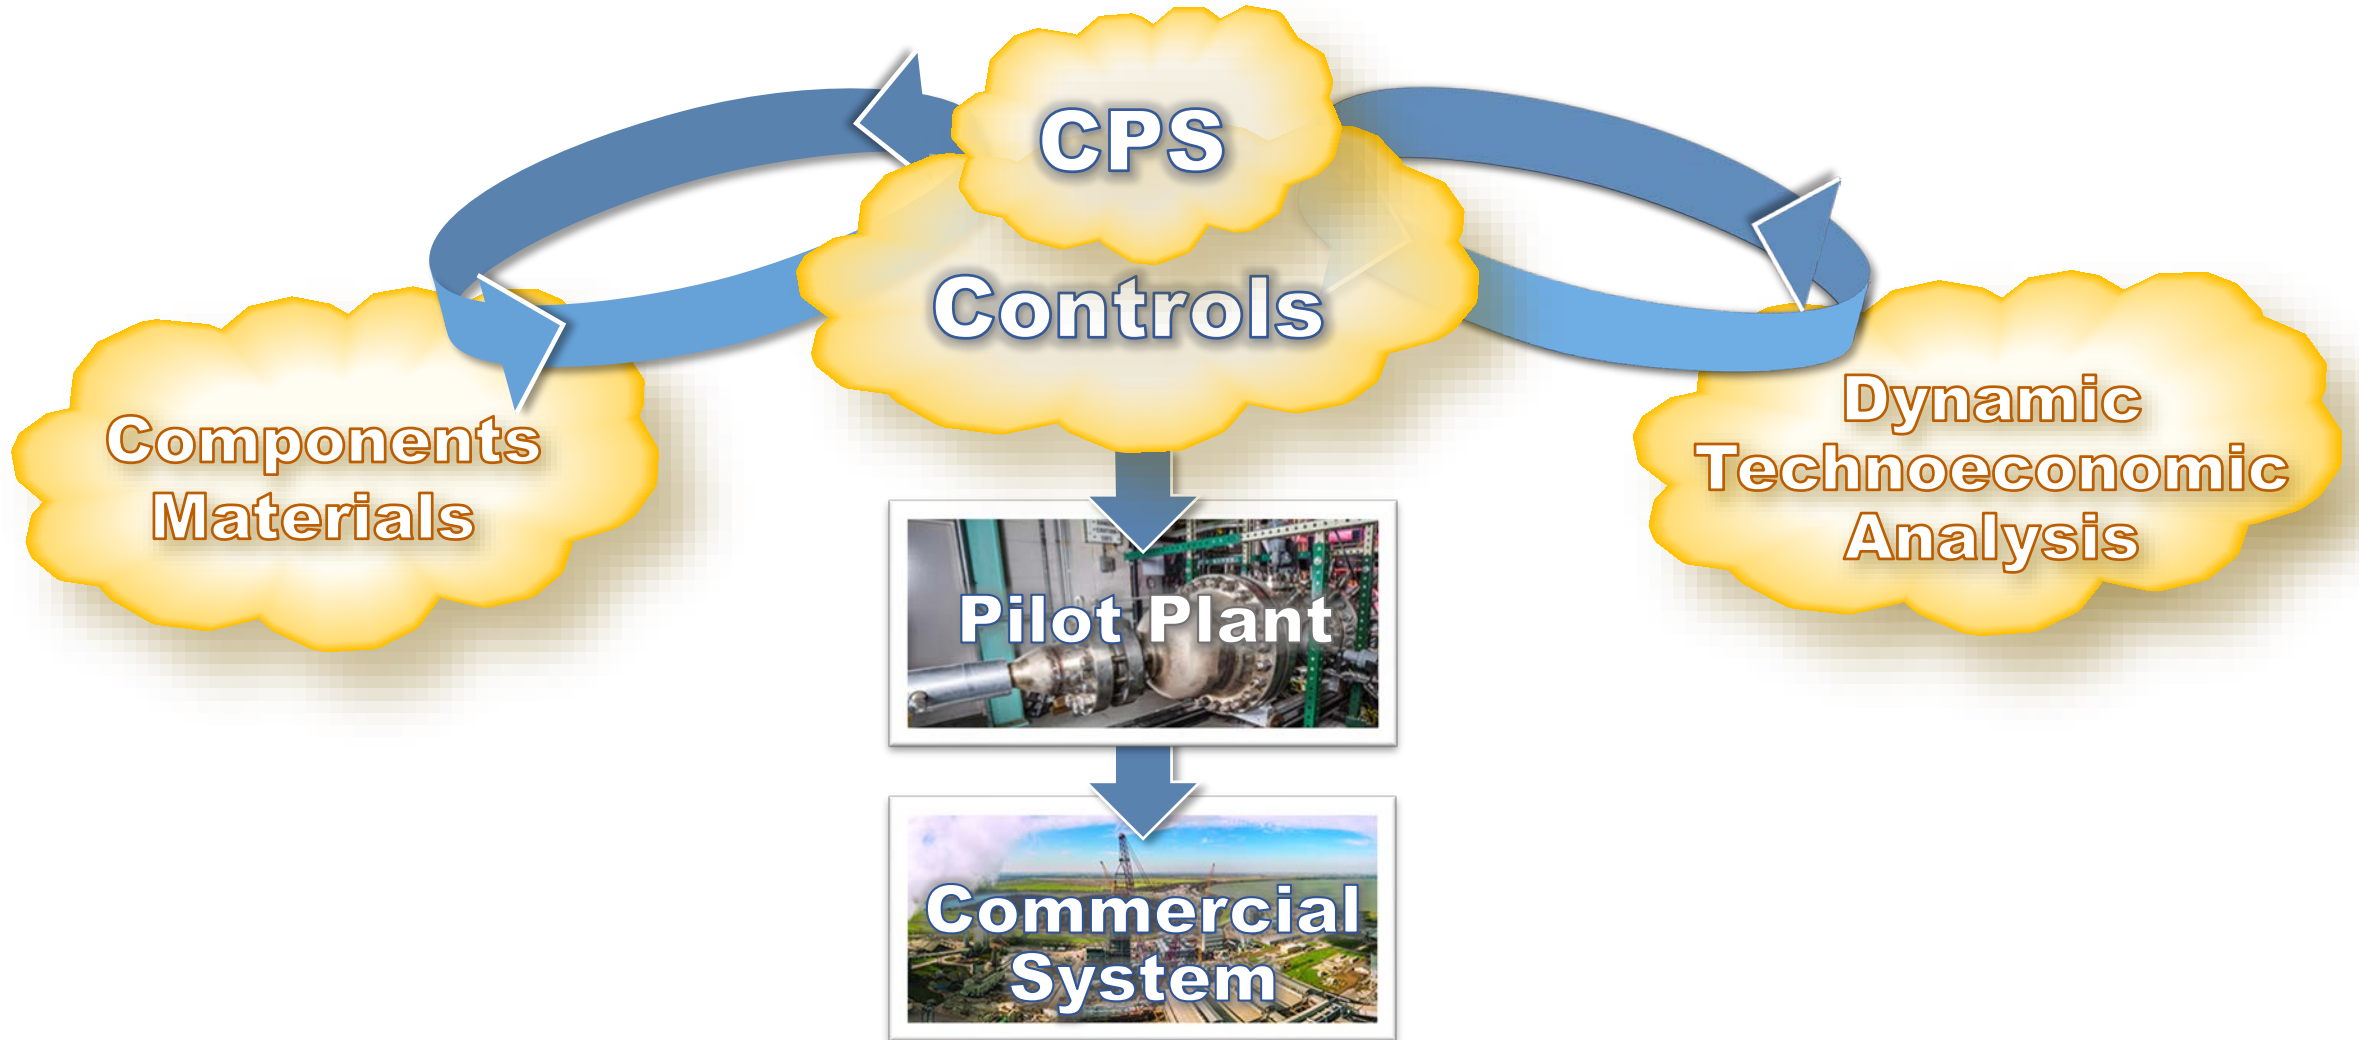

1. are irreplaceable,
2. are expensive,
3. can't meet performance targets.
4. don't exist...yet

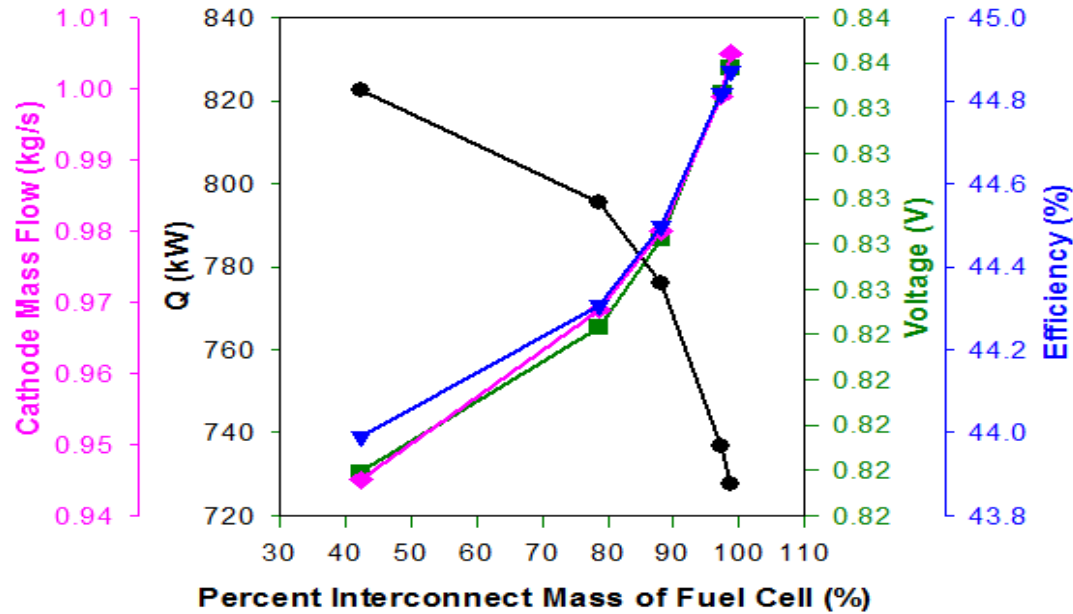

Technology Development

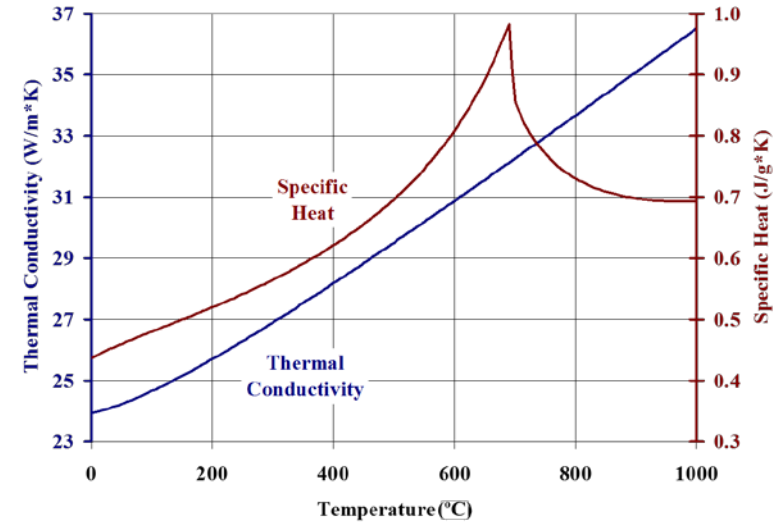

Technology Development

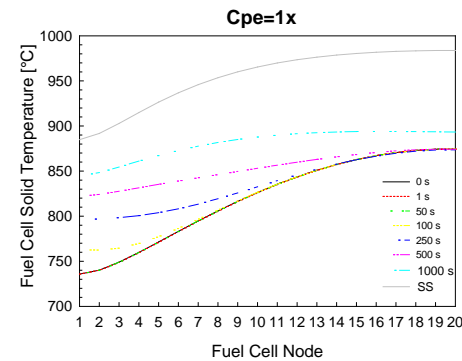

Example: TES in Hybrids for Load Following

Properties of SS441 Interconnect Material

Higher system efficiency and load following without risk to the fuel cell

Future Steps:

- Multiple sensors in one agent to control unobservable or slow responding parameters.
- Multiple sensors coordinated by supervisory control.
- Accelerate the response of the MISO turbine speed control by modifying the probability of action and block size. Currently, we have achieved 2kW/s (4%/s) in the Hyper facility, but 4kW/s (8%/s) would be required to eliminate a battery in an islanded microgrid based on NETL's power usage.

Advanced Controls will Change the World!!!

Thank You
