

Maturing 2nd Generation Technologies Research Triangle Institute's Water-Lean Solvent Process

DOE/FE/NETL has sponsored highly successful second-generation technologies that will dramatically reduce CO_2 capture costs. Research Triangle Institute's (RTI) Water-Lean Solvent Process is one of those technologies.

BACKGROUND

CHALLENGE:

- Current solvent capture technologies use mixtures of ~70% water and 30% amines to absorb CO_2
- The water has negative energy impacts and doesn't capture any of the CO₂ unlike the amines but the water controls the corrosivity and viscosity of the amines

RTI'S SOLUTION:

- Replace water with a hydrophobic non-aqueous solvent
- Total water in the mixture goes from ~70% down to ~5-10%

SIGNIFICANT RESULTS

Techno-economic analyses indicate:

Reduced Capital Costs Enhanced solvent performance results in smaller columns, heat exchangers, and footprint

Reduced Operating Costs Lower energy requirements

C

Lab/Bench-Scale Development Initiated 2009/2010

• Proof of concept/feasibility in 2009 and lab-scale testing initiated in 2010

- Bench-scale testing initiated 2014
 - Solvent formulation finalized
 - Reboiler heat duty < 2.0 GJ/tonne
- Preliminary techno-economic analysis shows capture cost \leq \$40/tonne

Scale-up Testing Initiated 2016

- Testing at 60-kWe scale conducted using actual flue gas at SINTEF's Tiller Plant pilot-testing facility in Norway
 1500+ hours of parametric and long-term testing on coal derived flue gas
- 1500+ hours of parametric and long-term testing on coal derived flu
- Additional testing at the National Carbon Capture Center
 570 hours at 50-kWe scale using coal-derived flue gas to evaluate operational issues

Follow Us

Large Pilot-Scale Testing Initiated 2018

- ~12 MWe scale testing at Technology Centre Mongstad (TCM) to evaluate the viability of the RTI solvent as a drop-in replacement for conventional capture systems
- Additional testing will modify TCM's existing equipment to evaluate optimized operation with the RTI solvent
