

Development of a cloud-based modeling framework for complex advanced power systems

Increasing energy use
Increasing impact on the environment
Increasing resource scarcity

Energy and environmental challenges

Interactions between
Engineered, human, and natural systems
are confounded by complexity

Holistic solutions are needed

Today we cannot model the richness, fullness, or complexity of engineered, human, or natural systems.

New modeling approaches are needed

innovation

decision making

engineering

...

**actionable information
that changes something**

Why create models?

Computers will gather of information and format it for decision makers ...

Old decision making paradigm

Snap

Build

Do

New decision making paradigm

Decision making environments that integrate all the information, models, and other artifacts related to a product or process.

“What if” environments

What's needed

1. Integration
2. Mediation
3. Interaction

Actionable information

What's needed

Information

1. Integration

2. Mediation

3. Interaction

Actionable information

Connects engineering decisions (e.g., design changes policy options) to specific high level outcomes

Why integration matters

This ...

- **Guides model development,**
- **Indicates inconsistencies and shortfalls in modeling,**
- **Focuses efforts on simulation based engineering, and**
- **...**

Why integration matters

“... a centralized model encompassing a set of other models”

- **integration framework**
- **global ontology and semantics**

“... a centralized model encompassing a set of other models”

- integration framework**
- global ontology and semantics**

Pre-determined meta model

model autonomy

high

unified models
(frameworks with normalized semantics)

federated model sets
(autonomous models with peer-to-peer controls)

low

centralized models
(one code with unified schema)

composite models
(one code with scripting)

low

high

ontological and semantic independence

Model portability

To provide

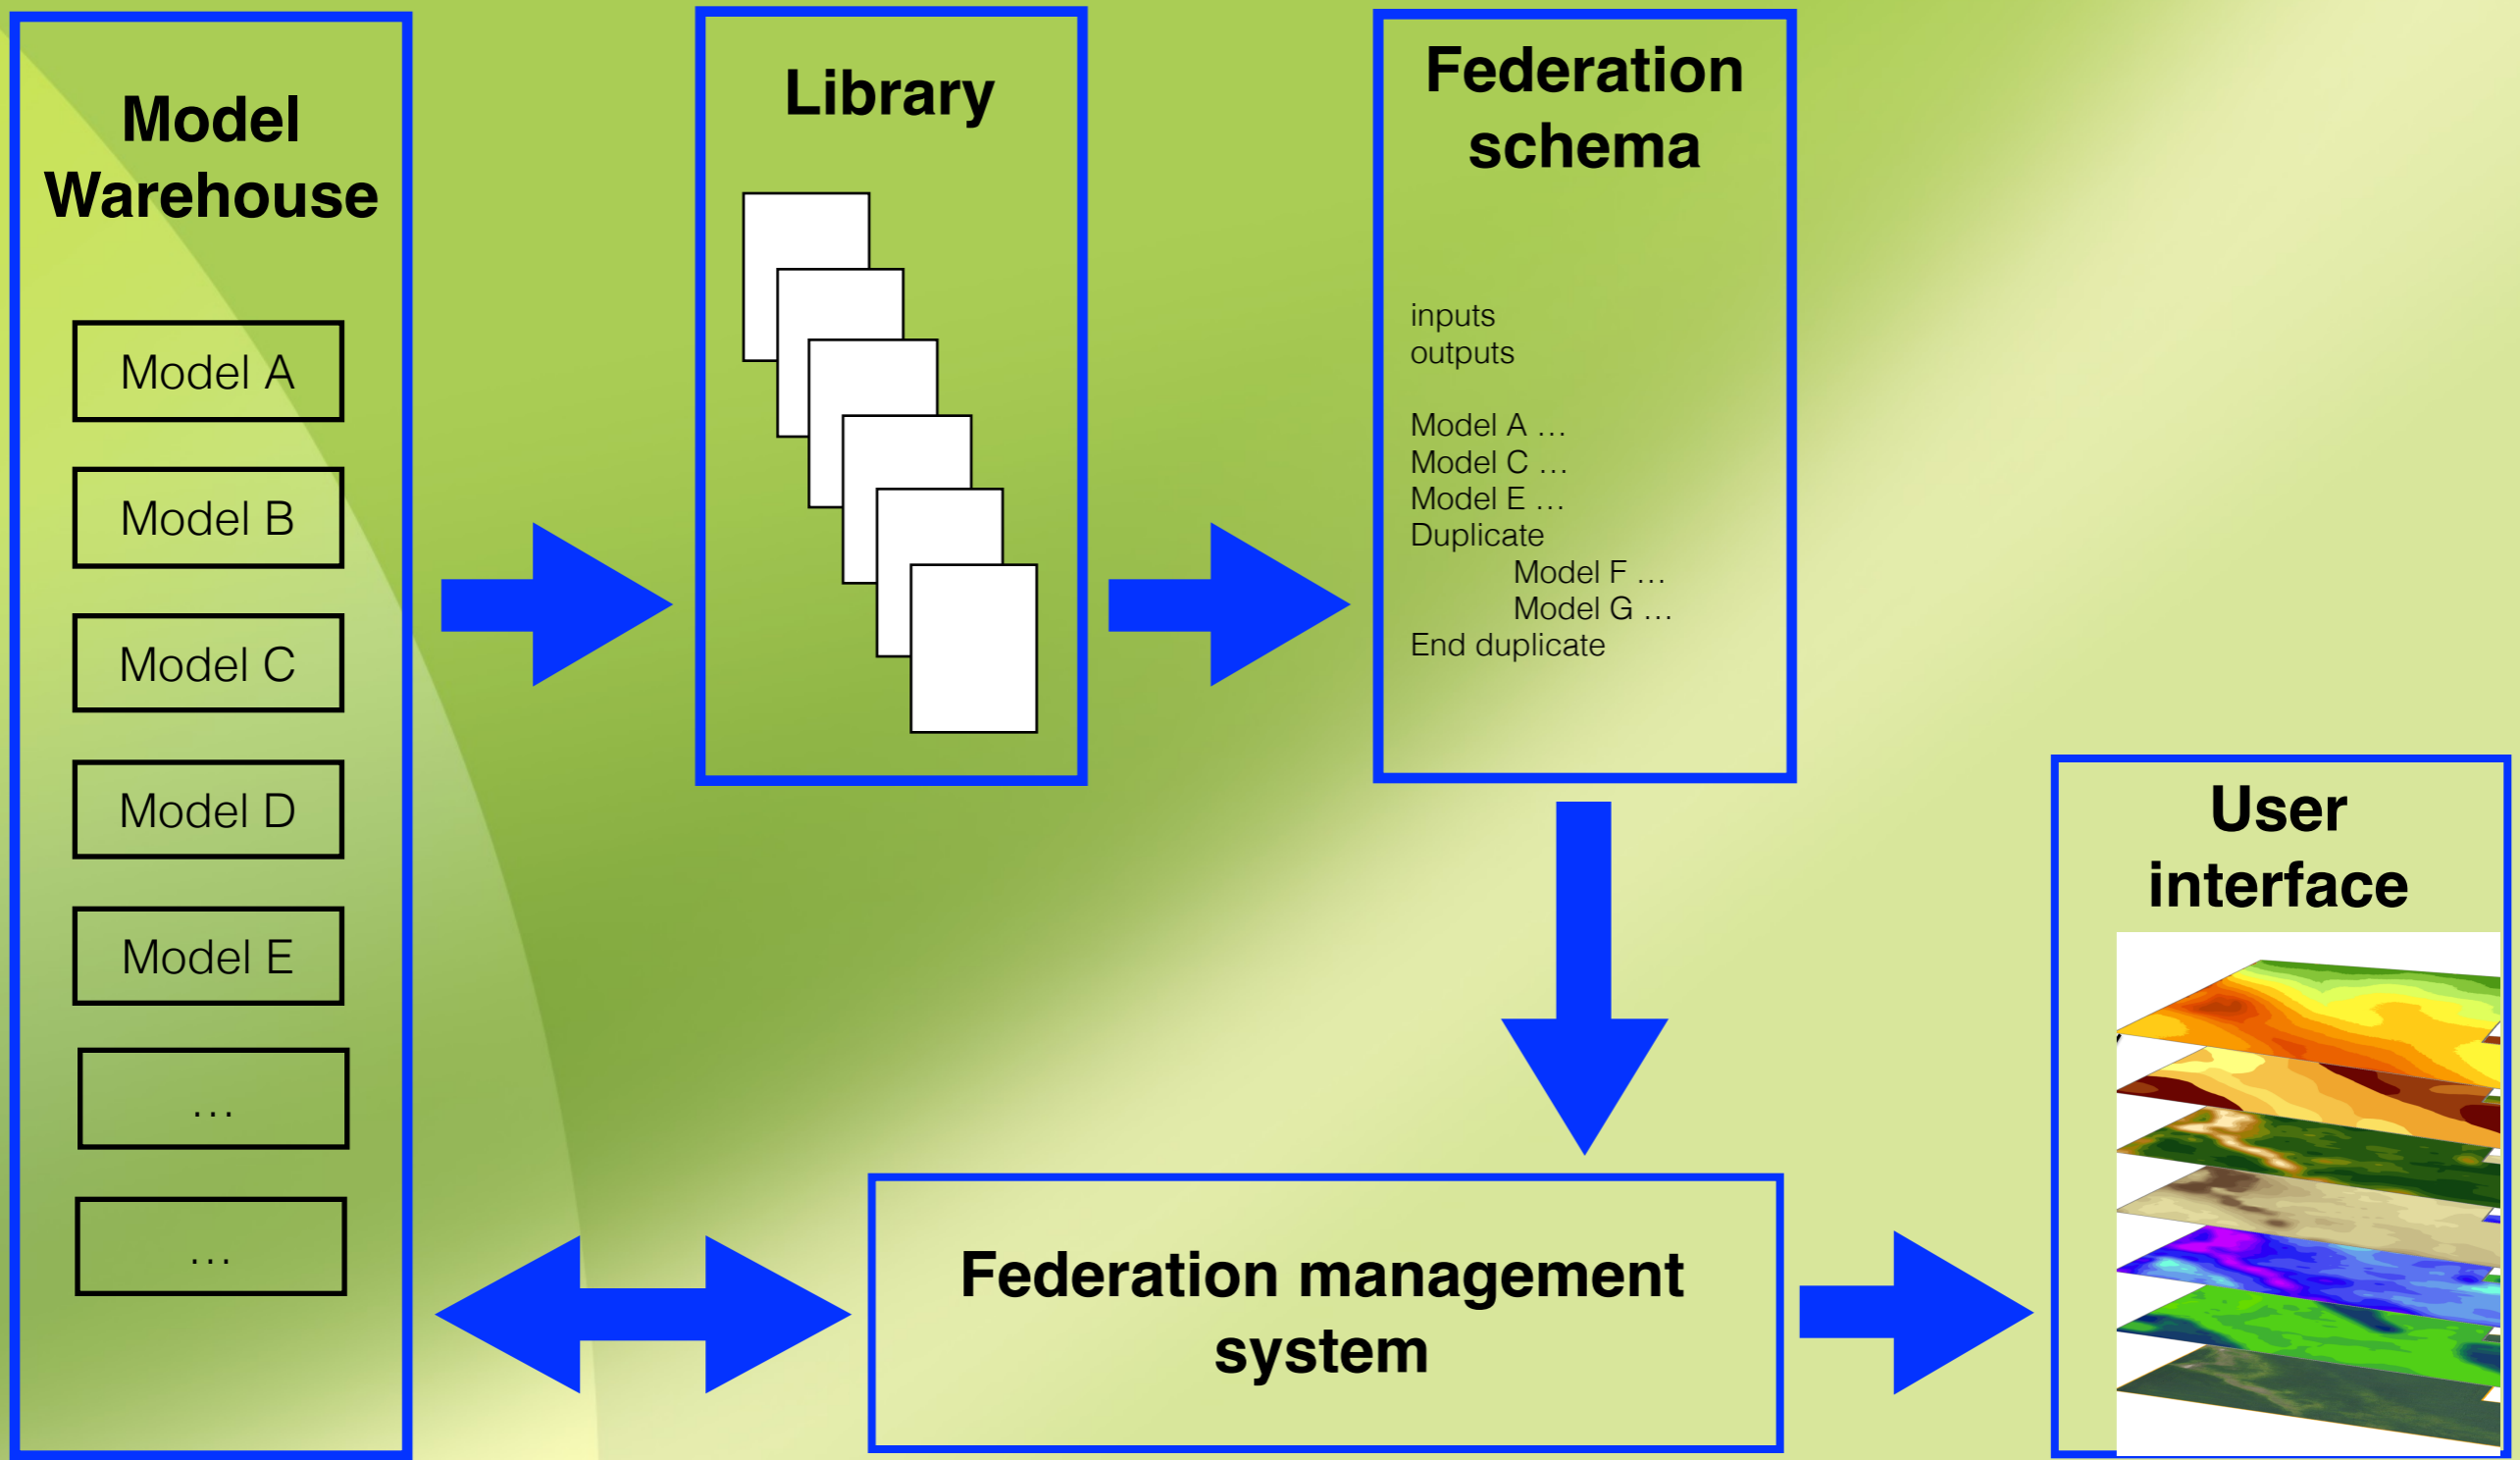

- high degree of independence for component models;
- a common, light-weight mechanism for model linkage; and
- a basis for deploying the federated model set.

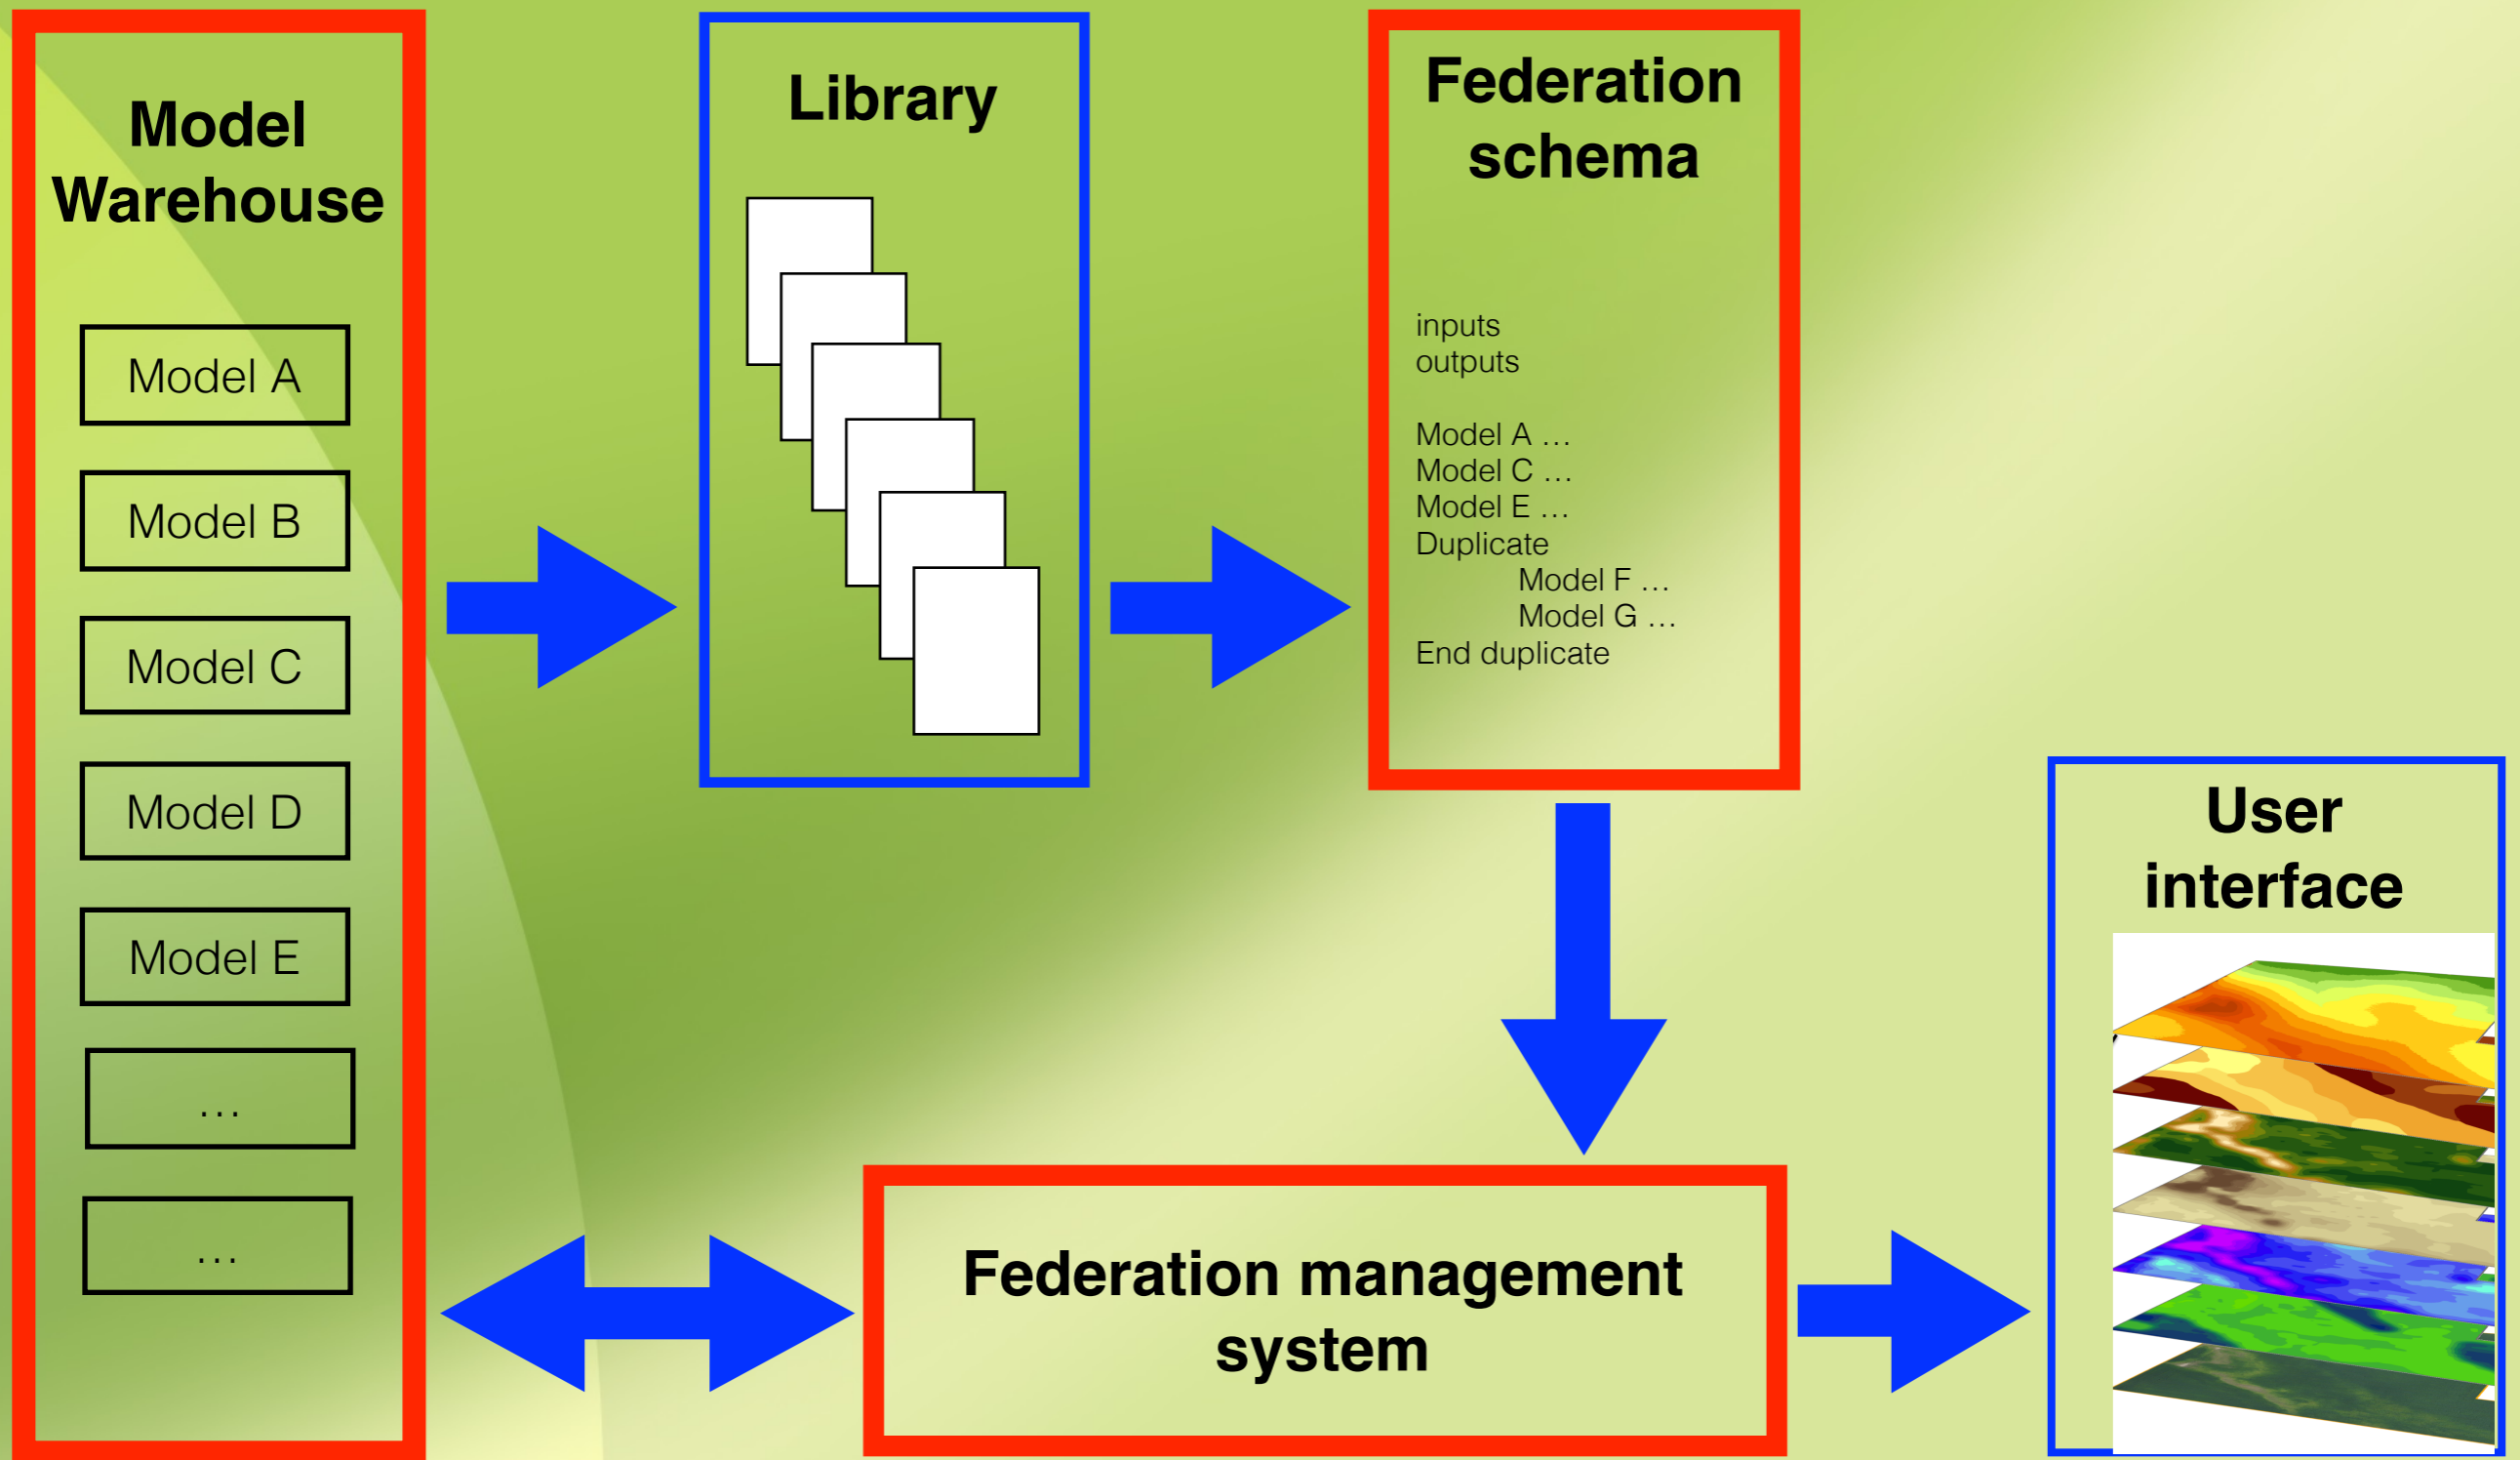

Goal of developing a new architecture

- **Constituency**
the capability of models to come together in groups that have coherence and substitutability
- **Articulation**
a simple and precise mechanism for describing how the models are chosen, linked, executed, and results reported
- **Convergence**
a knowledge of the topological mapping of the federation and the capability to route and converge information through the federation to complete the assigned tasks

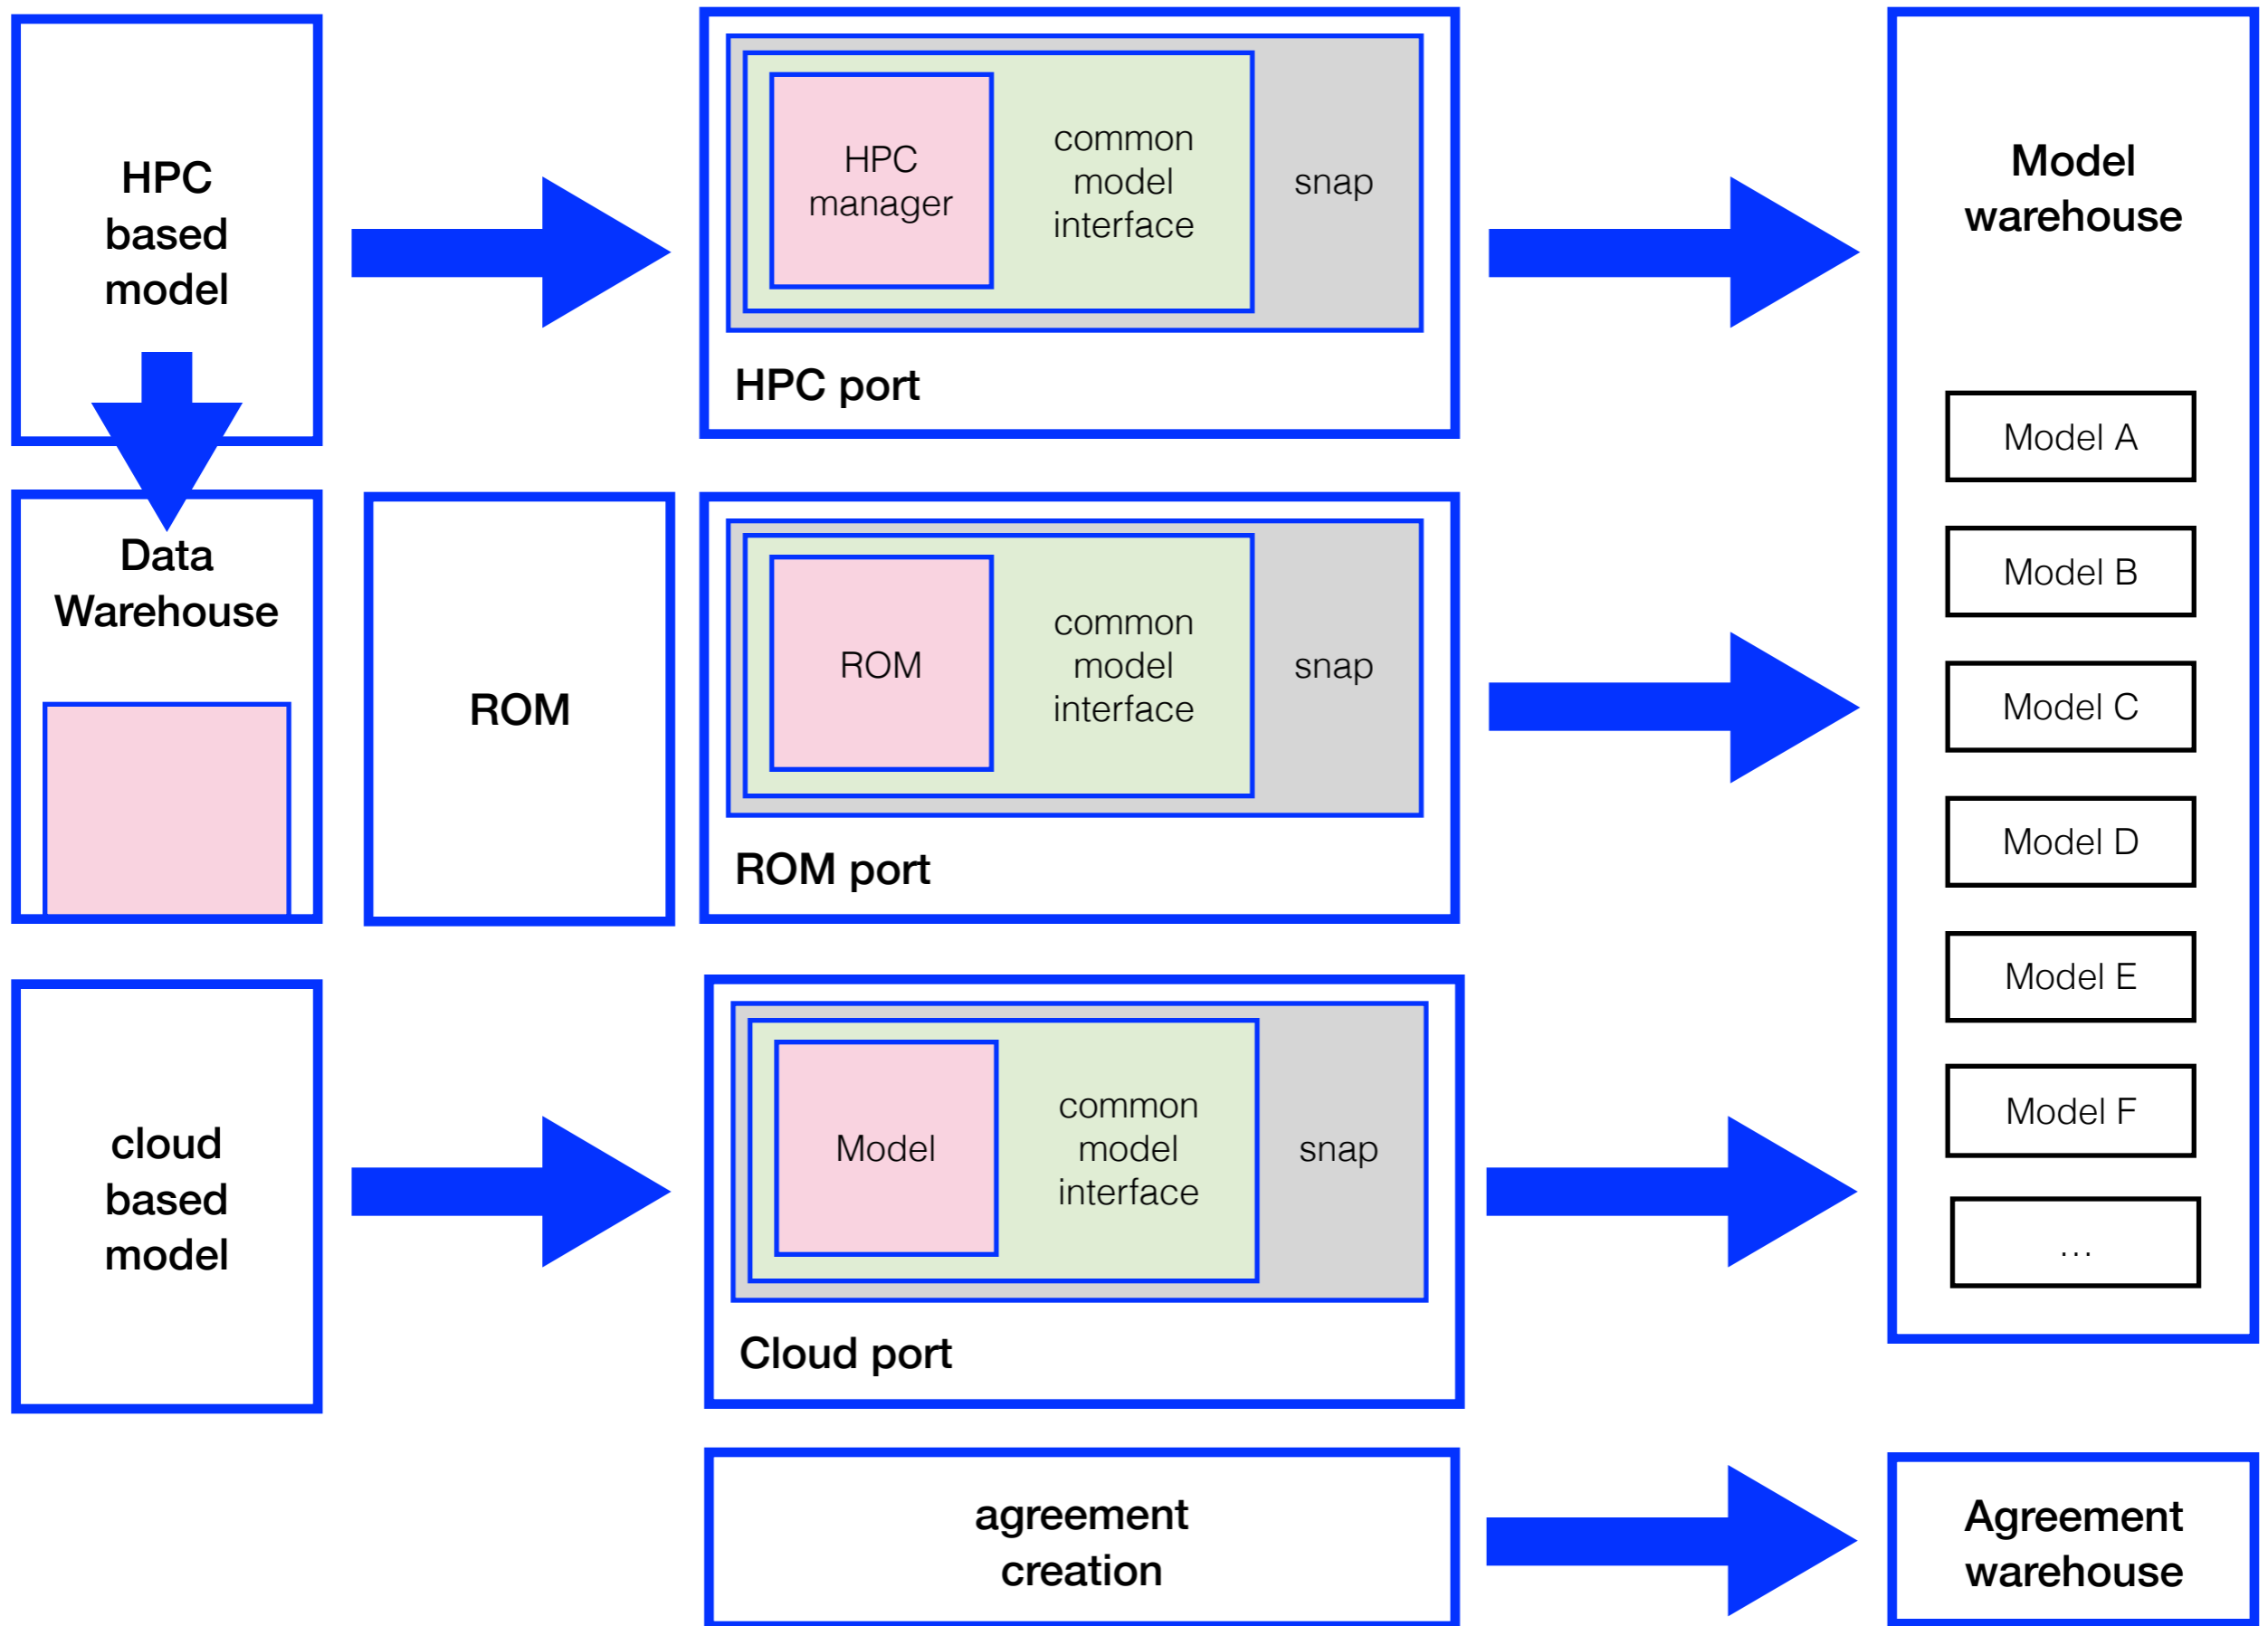

Components and information flow

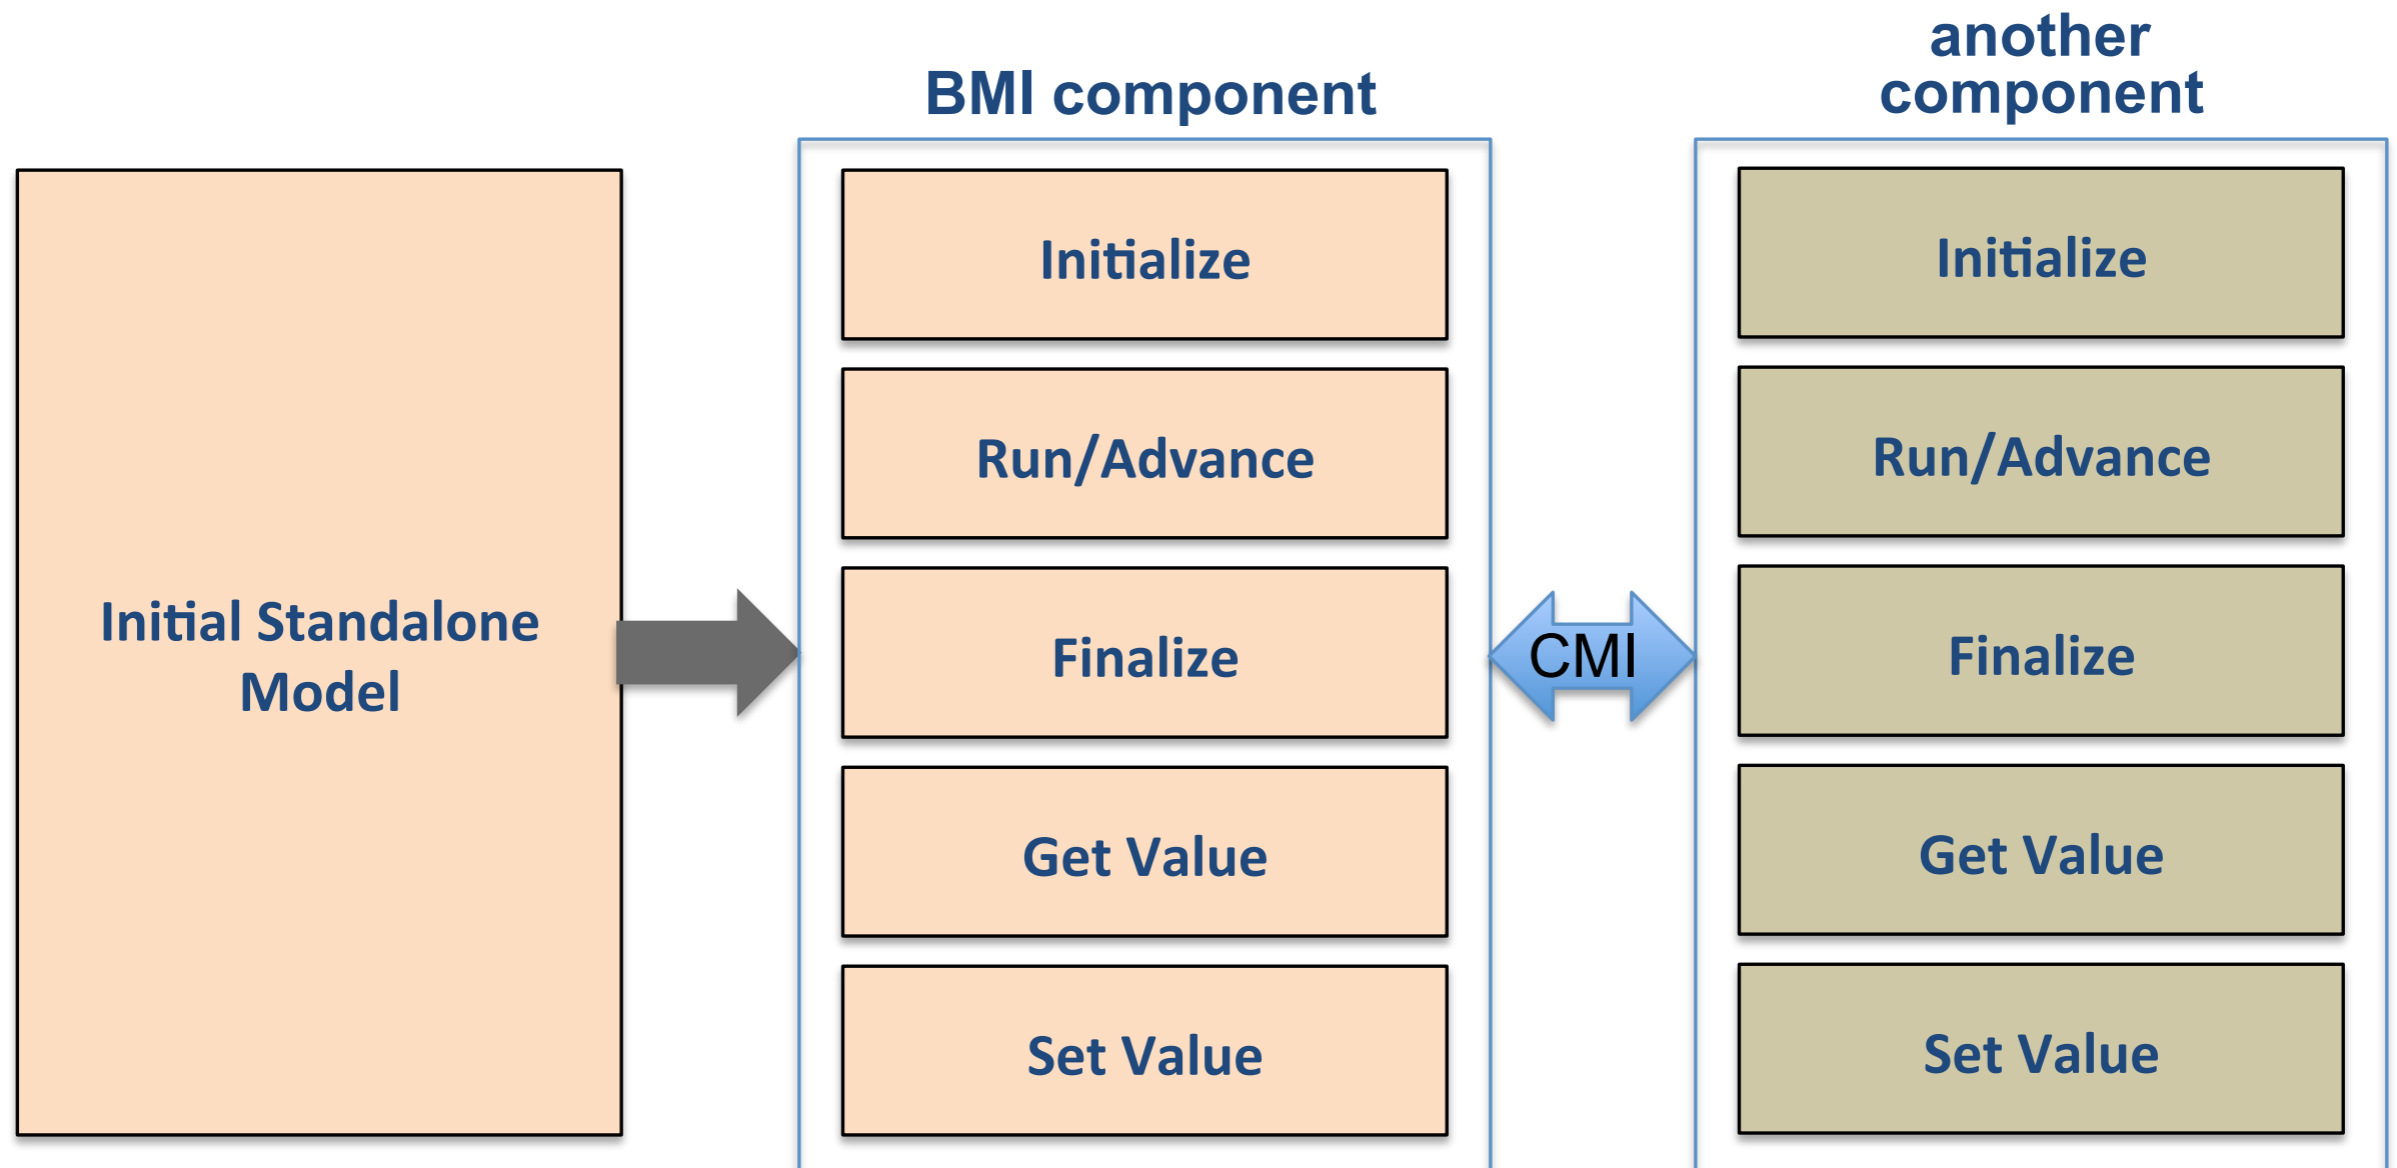

Components and information flow

- **Content creation process**
- **Model integration schema,**
- **ROM management schema**
- **Federation management system**
- **Development of a domain specific language**

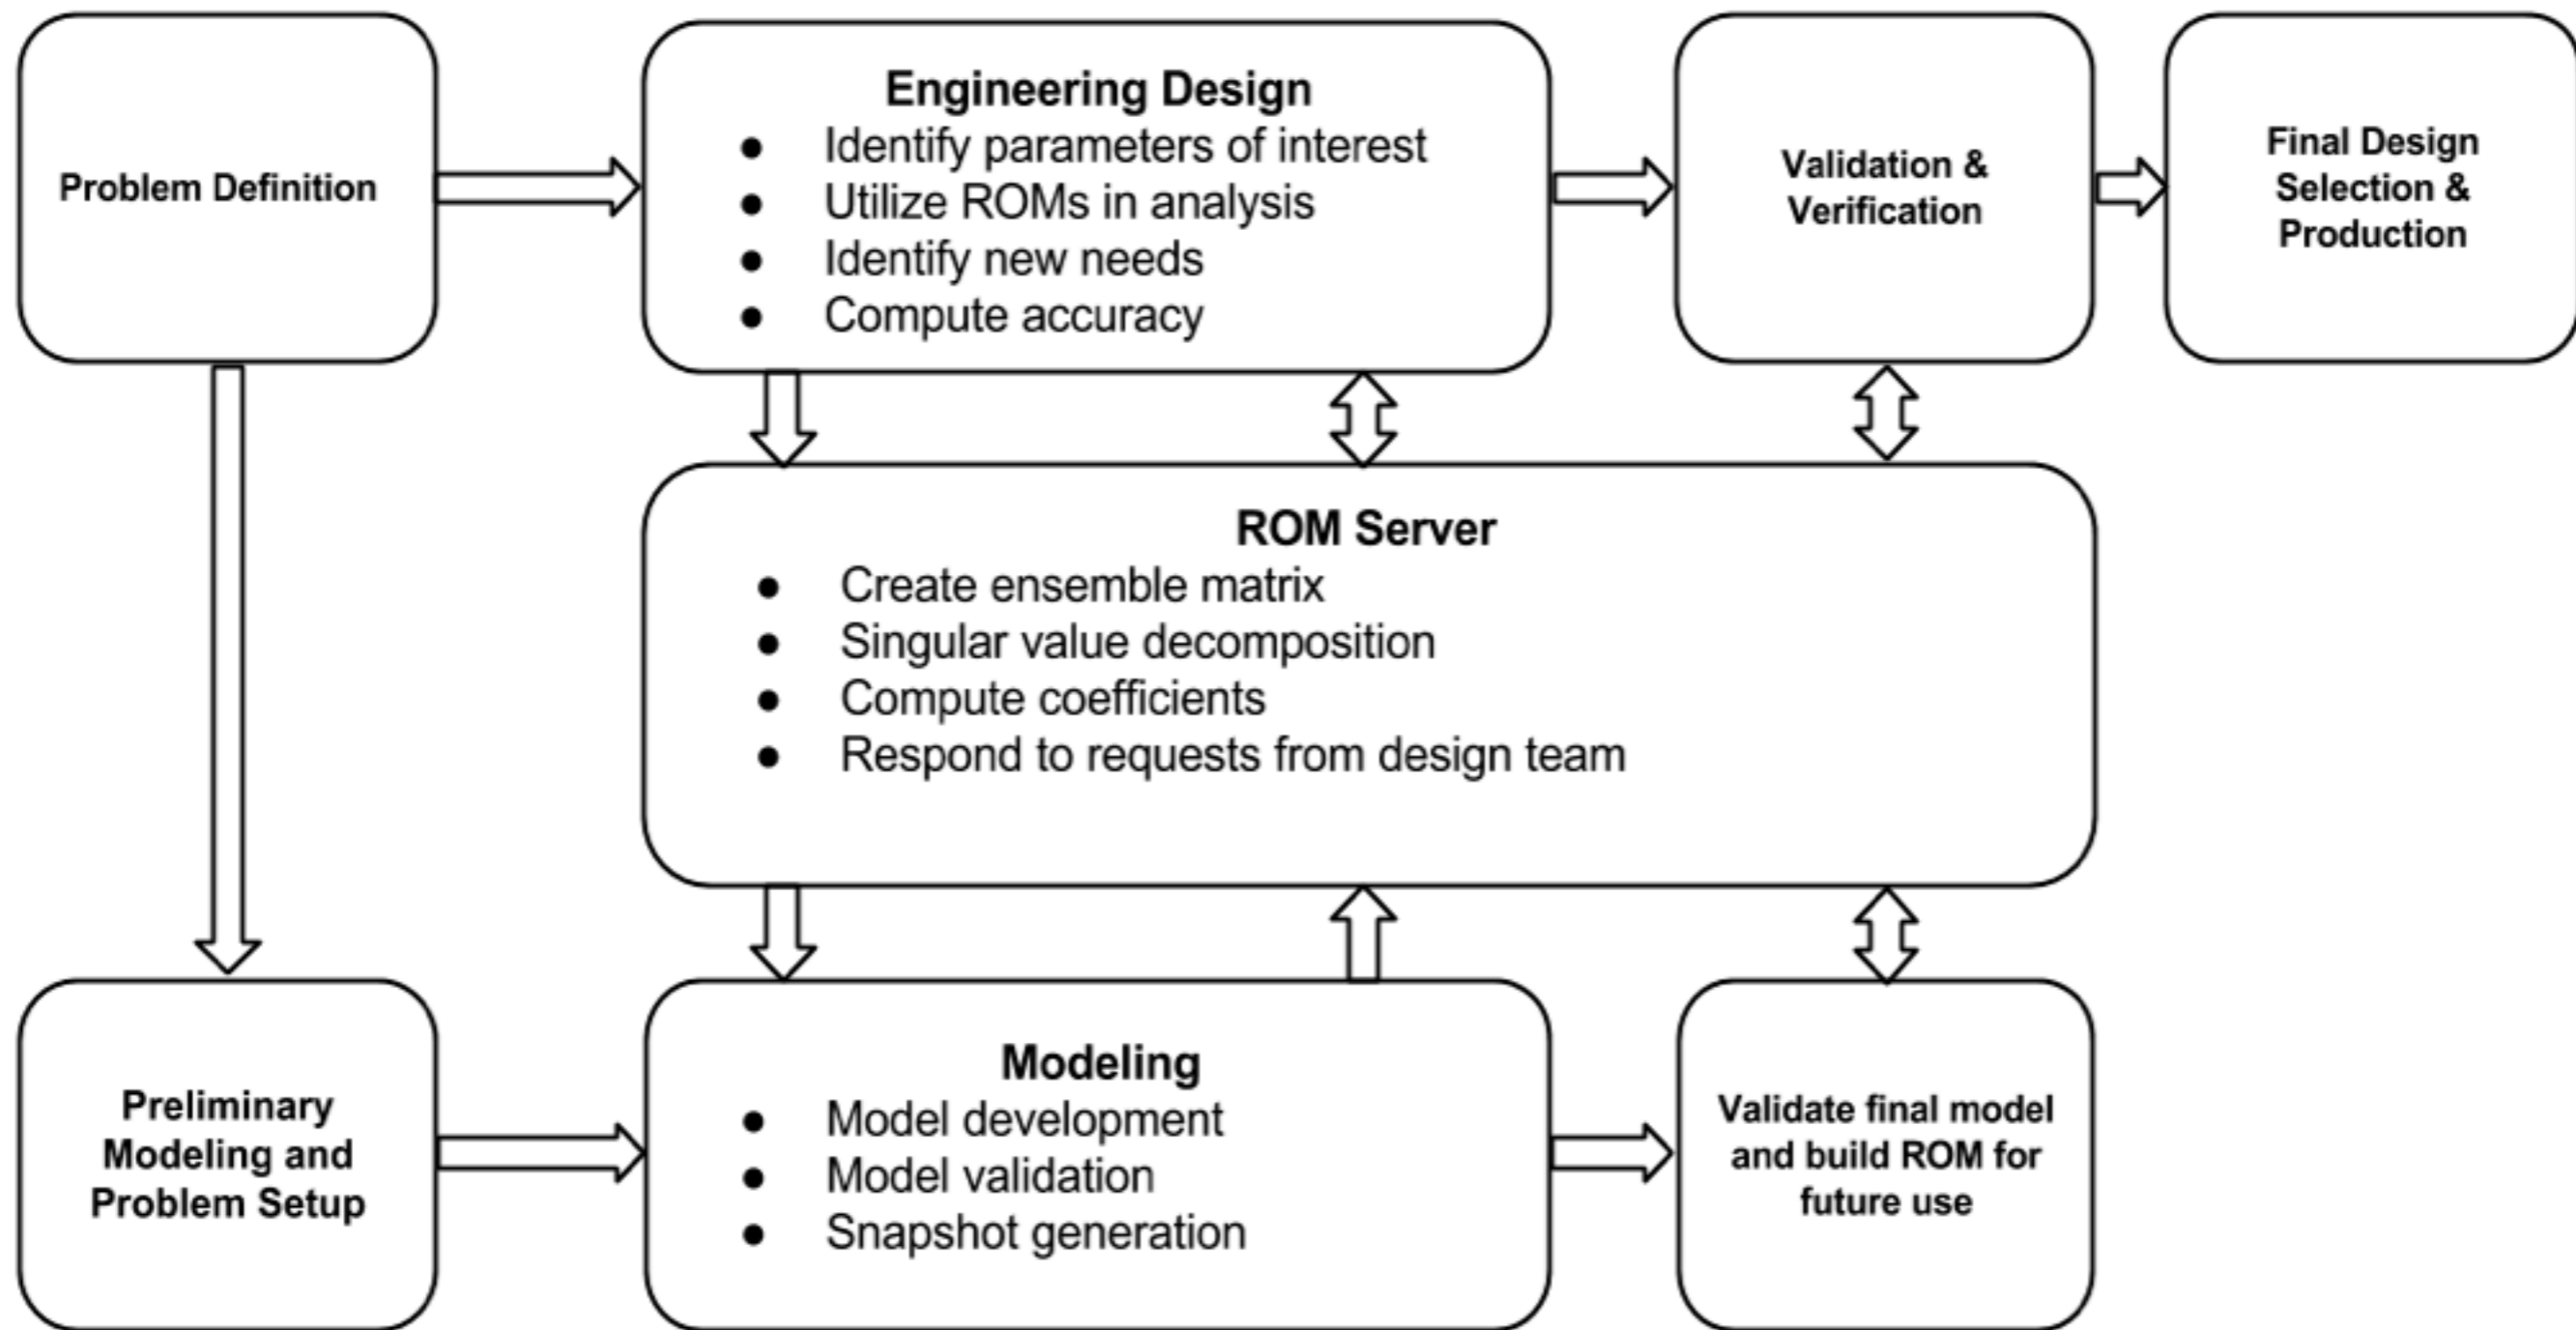

User defined content creation process

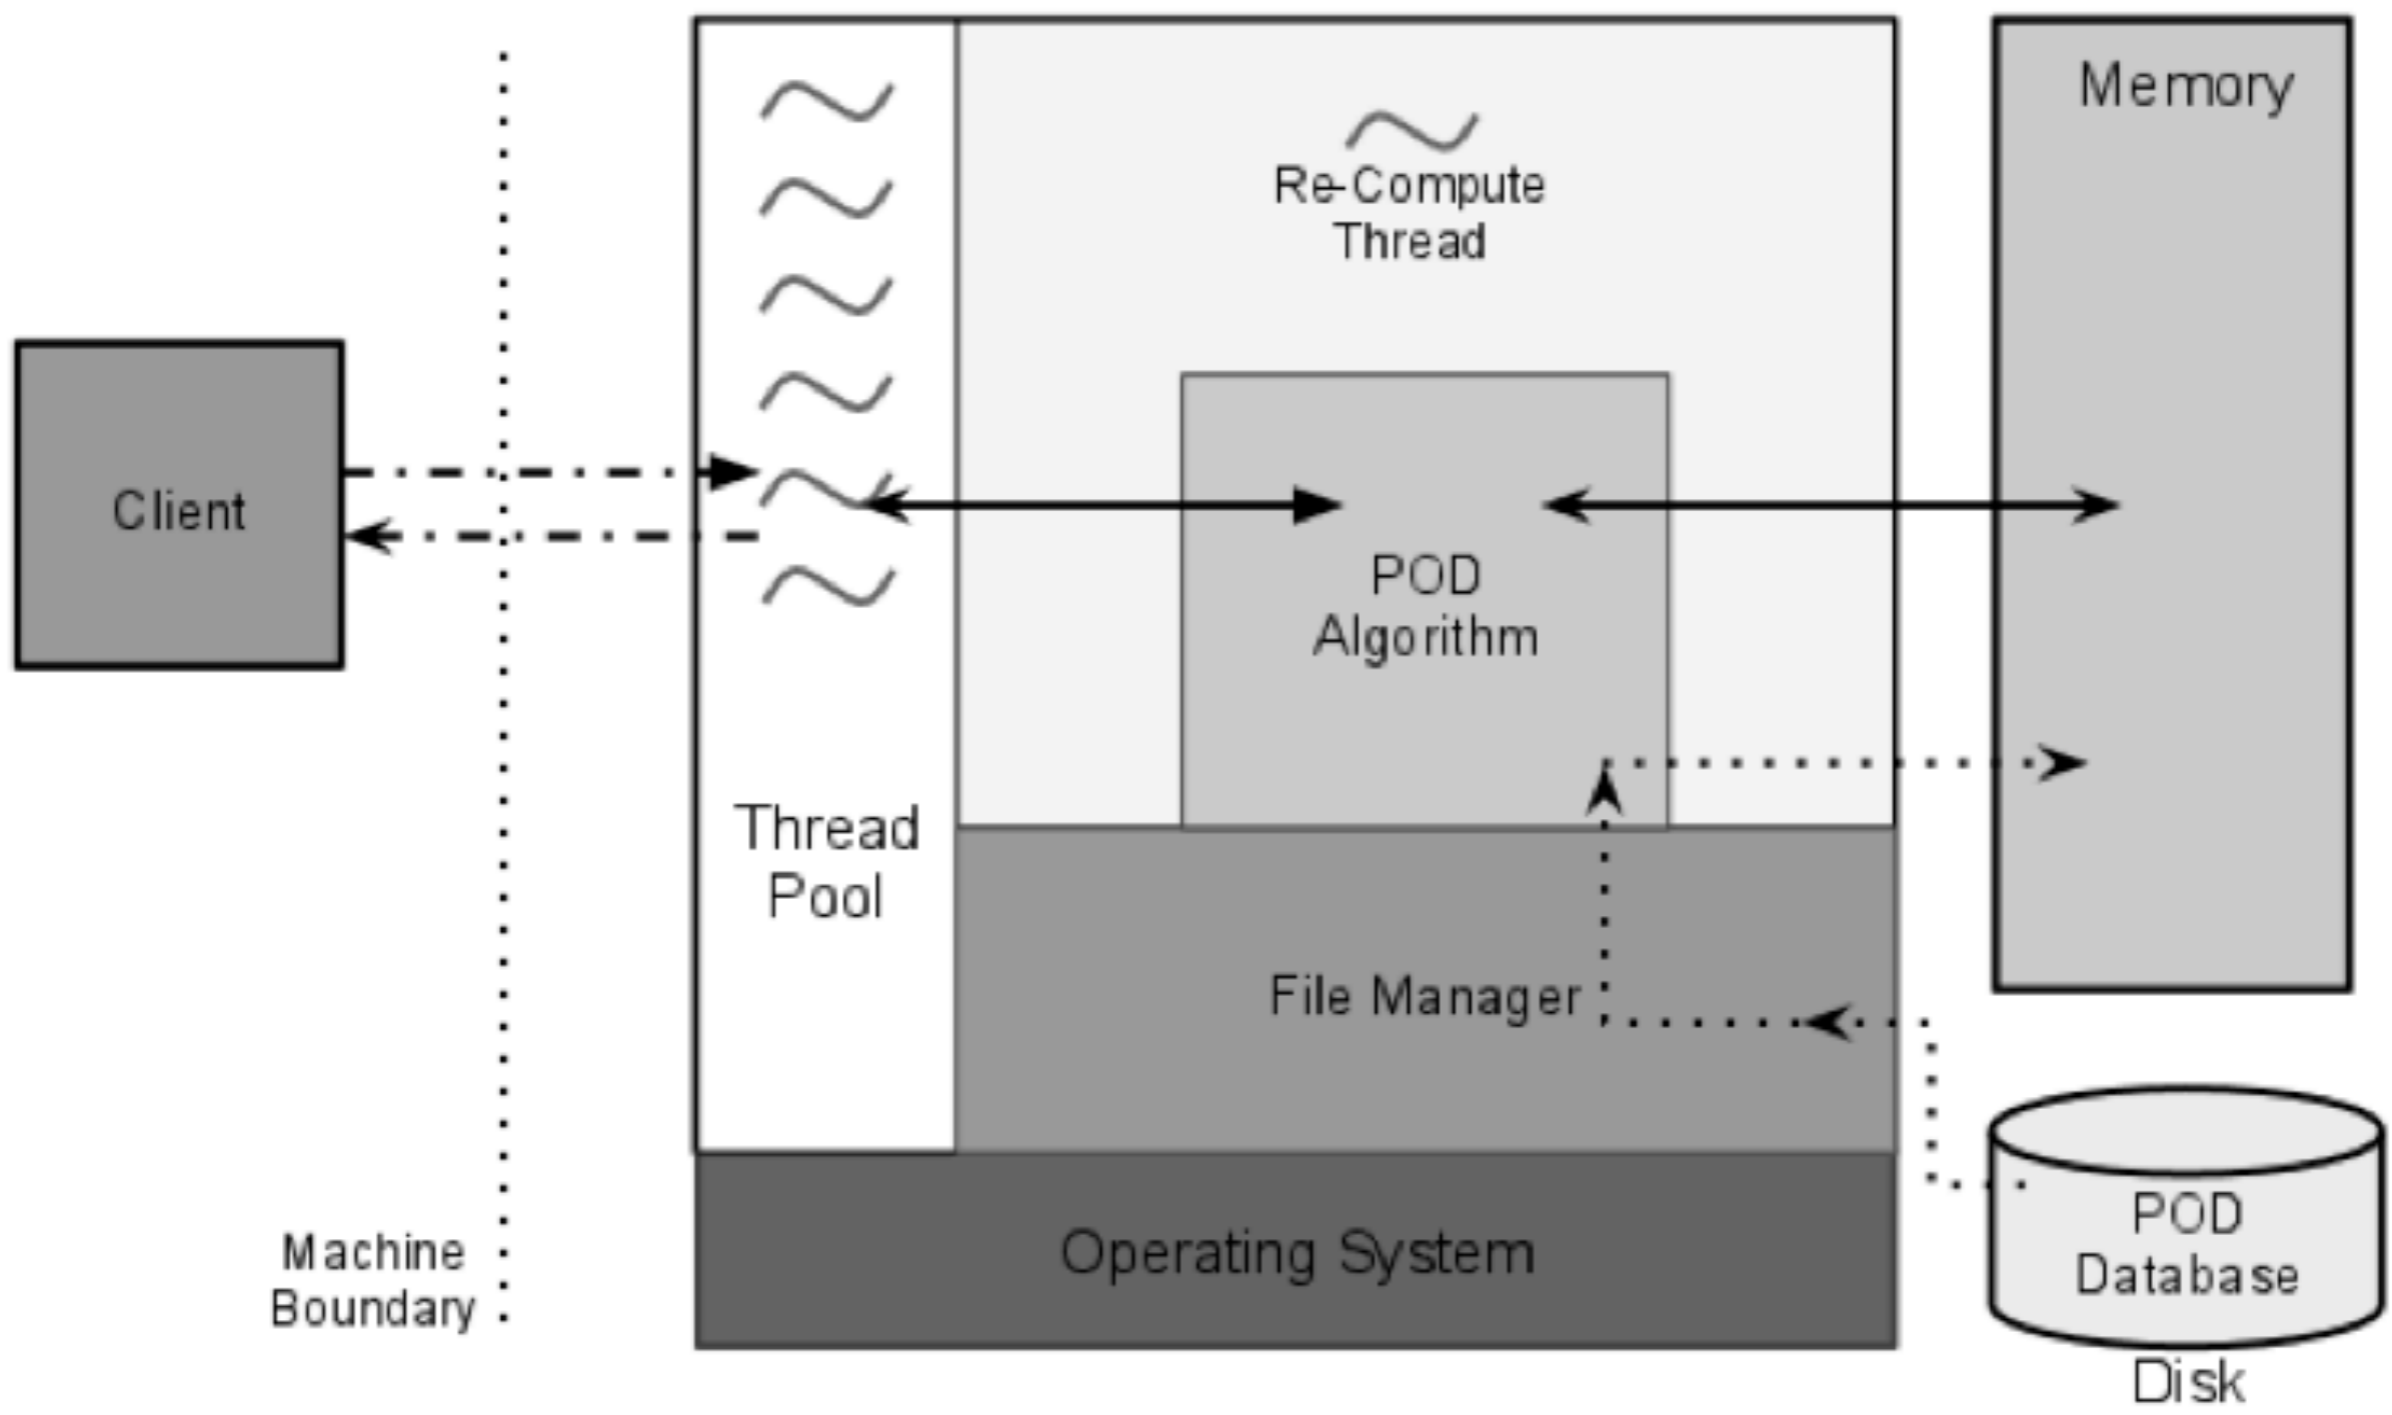

initial model integration schema

ROM management schema

ROM Server

User sees the web interface

Federation management system

Domain specific language

- starting point is University of Colorado work on systems integration,
- define energy specific needs,
- provides an engineering workspace.

- Initial demonstration of an application based on analysis as a web based service,
- Develop federated model of the NETL Hyper system,
- Extend Federation Management System
- Define other example cases.
