Presentation Outline

• CaMI Background
• LBNL Activities at CaMI
  – Borehole Geophysical Monitoring, EM and Seismic
Field Research Station (FRS) : Location

Land leased from Cenovus Energy

From Lawton, 2016
CaMI/UofC – Field Research Station (FRS)

- A world-leading site for development and demonstration of MMV technologies for fluid containment and conformance
- Undertake controlled CO$_2$ release at 300 m (Phase 1) & 500 m (Phase 2) depth; up to 1000 t/yr
- Determine CO$_2$ detection thresholds for different monitoring technologies
- Improve and develop monitoring technologies for tracking the CO$_2$ plume migration and for cap rock assessment
- Monitor gas migration at shallow to intermediate depths and impacts on intermediate depth groundwater (CO$_2$ and CH$_4$)
- Determine fate of CO$_2$ & CH$_4$ (trapping/dissolution)
- University & industry field training & research
- Integrating engineering and geoscience
- Public outreach & education

LBNL Activities Supporting CaMI Monitoring

• Electromagnetic (EM) Monitoring
  – crosswell and surface-to-borehole EM
• Crosswell Seismic
• Fiber Optic Sensing
  – Distributed Acoustic Sensing (DAS):
    • Borehole and surface cables deployed;
    • Novel helical wound borehole cable deployed and tested (DAS VSP)
  – Distributed Temperature Sensing (DTS) with Heat Pulse
• Distributed Strain Sensing (DSS):
  • Cable deployment, modeling of geomechanical deformation
• Surface CASSM (Continuous Active-Source Seismic Monitoring)
  • Surface Orbital Vibrator (SOV) source and DAS sensing – design and planning
• U-Tube Fluid Sampler
• Applying Higher TRL Tools to Novel Experiment
  – Borehole instrument deployment
    • Integrated DTS – Heat Pulse cable
    • U-tube fluid sampling
    • Pressure-Temperature Gauge
  – Cross-well seismic surveys (LBNL)

• Advancing Lower TRL Tools
  – Cross-well electromagnetic (EM) surveys*
  – Borehole-to-Surface (BSEM) electrical/EM surveys*
  – Surface helical fiber cable for DAS surface seismic
  – Borehole helical fiber cable for crosswell DAS

*Technology utilizing available fiberglass casing
2016-2017 Design and Installation of Monitoring Cables – Fiber and Electrical

Multi-Physics - Seismic and EM: Motivation

- Seismic alone has uncertainty at high CO2 saturation and uncertainty in rock physics interpretation
- EM has strong sensitivity at all saturations
- Seismic good for initial detection and defining plume edges
- EM good for estimating saturation within plume

Vasco, et al, 2014
Boerner, et al, 2015
Crosswell EM

- Moving ‘shelved’ prototype system to field operation – multi-level sensors
- Obtain 2D resistivity map at depth
- Frequencies from 10 Hz to 20 kHz*
- Well spacing's from 20m to over 500m, and depths to 2km.
- Only one Fiberglass well available for CaMI Phase 1, so frequency is reduced (~200 Hz)

* Higher Frequency than commercially available

High Frequency EM Tomography: Developed for EOR monitoring (Wilt, et al, 1995)
Crosswell EM Tools

Transmitter Source
- **Size**
  - Diameter 3.5” (8 cm)
  - Length ~12 ft (4 m)
  - Weight ~120 lbs (50 kg)
- **Coil Make up**
  - 2.5” Ferrite core 8 ft long
  - 1000 turns of wire on core
  - Tuning capacitors on internal circuit
- **Frequency**
  - 1-4000 Hz
    - 1-500 Hz untuned,
    - Tuning 1, 1.5 2 and 4 khz. Selectable by software
- **Dipole Moment**
  - Maximum moment 1500 A-m²

Sensors (1-5 levels)
- **Size 2-level (5 m spacing)**
  - Diameter 2.5” (7 cm)
  - Length ~6 ft (2 m)
  - Weight ~30 lbs (12 kg)
- **Coil Make up**
  - 1” mu-metal core 1m long
  - 20,000 turns of wire on core
  - Tuning capacitors on internal circuit
- **Frequency**
  - 1-10000 Hz; Flat 10-1000Hz
  - 1-500 Hz untuned,
  - Tuning 1, 1.5 2 and 4 khz. Selectable by software
- **Sensitivity**
  - 0.1 V/nTesla
  - Noise estimated at 10⁻⁶ nT
Monitoring Arrays at CAMI

BSEM = Borehole to Surface EM: ~1+km

Crosswell: 50 m
EM Model and Inversion (Xwell and BSEM)

- **EM Model:**
  - Based on 1 year injection simulation
  - Source 300 Hz, Assume random noise
  - Different injection depths used

- Modeling/Imaging - EMGEO: *3D EM parallel finite-difference code*

- Crosswell: Final image places boundaries and depths properly but slightly underestimates resistivity

- **BSEM:** Inversion finds leading edge of CO₂ body but has trouble mapping distal edge
Baseline Field Surveys 11/16
Successful Acquisition

• Crosswell EM
  – good quality data
  – Receiver depths only to 220m due to a cable issue

• Borehole to Survey EM
  – poor data quality due to grounding issue
Crosswell EM field data Inversion

- Receivers used: 220,200,190m
  - Estimated noise 3%
  - Inversion domain: z=125 to 325m
- Results are consistent with logs but provide a muddy image
  - Likely due to limited receivers and low frequency (200 Hz)
- BSEM gave poor results due to improper grounding

Conclusion: A new baseline acquisition is recommended and planned

Crosswell data and Model: f= 200 Hz
Crosswell Seismic

Initial Baseline Survey (11/16):
• Sensor: Hydrophone array – 20 sensors at 5 m spacing
• Source: piezoelectric
• Source sweep: 300-2500 Hz
• Spatial sampling: 0.5 m

Data quality problems linked to sandpack well completion interval
Crosswell Seismic

- First Arrivals are good for travel time tomography, but
- Poor transmission near the sandpack completion interval
  - Gas in sandpack is possible cause

Zoom on First Arrival
2017 Field Campaign: Improved Baseline

- Plan field acquisition for 9/17
  - Crosswell EM and BSEM
    - Use higher crosswell frequency (450 Hz)
    - Use dual frequency BTS EM, collect data using cable system, borehole electrodes and trench ERT surface array
    - Will jointly process and interpret EM data
  - Crosswell Seismic
    - Increase S/N
    - Demonstrate repeatability
Continuous Seismic Monitoring:

Surface Orbital Vibrator: A Controlled AC Motor w/Eccentric Mass + DAS

Max Frequency 80 Hz, Force (@80Hz) 10 T-f
Phase stability is not maintained. Operate 2.5 hr/d

• Baseline DAS VSP with novel helical wound borehole fiber cable – field plot

Force is adjustable

\[ F = m \omega^2 r \]
DTS and Heat Pulse

July 2017 Test

Anomalies may be gas in sandpack, to be confirmed

Temp

Depth in Well (down and back up)
Accomplishments to Date

• Collaboration with CaMI on monitoring program
• Development of crosswell EM instrumentation (raise TRL level)
• Deployment:
  • Fiber optics in wells; helical and straight fiber cable in observation wells – first time for helical in well!
  • U-Tube geochemical sampling system in observation wells
  • SOV (surface orbital vibrator) seismic source
• Acquisition of initial data:
  • Crosswell EM and Seismic, BSEM;
  • Heat-pulse, U-tube
Project Summary

– Key Findings
  • CaMI fills an important need in storage R&D: intermediate depth, gas phase detection/monitoring
  • A comprehensive monitoring program is testing higher TRL tools and advancing lower TRL tools
  • Deploying Crosswell EM and seismic; U-Tube sampling; heat pulse monitoring; surface and borehole helical DAS;

– Lessons Learned
  • Plans need to be flexible while project is developing (e.g. change from 2 fiberglass casing to 1 and 1 steel
  • Best to allow for repeat of baseline geophysics to allow for learnings from initial data acquisition

– Future Plans
  • Acquire new baseline data ~ Sep 2017
  • Begin injection
  • Monitor co2 plume
Synergy Opportunities

- Deployment of fiber optic cables in the subsurface allows multiple measurements (Temperature, Acoustics, Chemistry)
- Permanent sensor deployments with semi-permanent sources allows ‘continuous’ and ‘intelligent’ monitoring

From Lawton, 2016
Benefit to the Program

• Program goals being addressed:
  – Develop and validate technologies to ensure 99 percent storage permanence.
  – Develop technologies to improve reservoir storage efficiency while ensuring containment effectiveness

• Project benefits:
  – Deployment and testing of new monitoring technologies and methodologies.
  – Broader learnings from leveraged international research opportunities
  – Rapid transfer of knowledge to domestic programs
Project Overview:
Goals and Objectives

- The Core Carbon Storage and Monitoring Research Program (CCSMR) aims to advance emergent monitoring and field operations technologies that can be used in commercial carbon storage projects. This effort aligns with program goals:
  - Improve estimates of storage capacity and sweep efficiency
  - Develop new monitoring tools and technologies to achieve 99% storage confirmation
- Success criteria is if we are able to advance the technology readiness level (TRL) of targeted technologies from a level of TRL 2 – 3 up to 4 – 5 through leveraged field testing opportunities, with field sites being used as in-situ laboratories.
Organization Chart

• CMC CaMI Project Management: Don Lawton
• CMC CaMI monitoring lead: Don Lawton
• LBNL
  – co-PIs: Tom Daley and Barry Freifeld
  – Field Support, Installation and Instrumentation: Paul Cook
  – EM R&D: Mike Wilt
  – Crosswell Seismic: Pierpaolo Marchesini

• Carbon Management Canada (CMC) organized the Containment and Monitoring Institute (CaMI) which is led by Don Lawton. Mark Piercy of Schlumberger provides in-field logistical support and management at the CaMI Field Research Station (FRS).
**TASK 4. Carbon Management Canada FRS Collaboration**
