NORTH DAKOTA INTEGRATED CARBON STORAGE COMPLEX FEASIBILITY STUDY DE-FE0029488

U.S. Department of Energy National Energy Technology Laboratory Addressing the Nation's Energy Needs Through Technology Innovation – 2019 Carbon Capture, Utilization, Storage, and Oil and Gas Technologies Integrated Review Meeting August 26–30, 2019

> Wes Peck Principal Geologist

NORTH DAKOTA CARBONSAFE

BERV

- Address technical and nontechnical challenges specific to commercialscale deployment of a CO₂ storage project in central North Dakota.
- Long-term goal: develop a certified (permitted) geologic storage opportunity should a business case for CO₂ storage emerge (and it is!).

NORTH DAKOTA CARBONSAFE

U.S. DEPARTMENT OF

- U.S. Department of Energy
- NDIC Lignite Research Council
- Basin Electric Power Cooperative
- ALLETE Clean Energy
- Minnkota Power Cooperative
- BNI Energy
- North American Coal
- Prairie Public Television
- Schlumberger Carbon Services
- Computer Modelling Group, Ltd.

INDUSTRIAL COMMISSION OF NORTH DAKOTA

AN ALLETE COMPANY

NORTH DAKOTA'S LEVERAGE

NORTH DAKOTA CARBONSAFE CO₂ SOURCE OPTIONS

PROJECT AREA

FIELD ACTIVITIES

- Drilled two new stratigraphic test wells.
 - Drill, core, log, plug, and abandon
- ~300 feet of core from each well.
 - Broom Creek (target) and Opeche Formations (seal)
- Geophysical logging and fracture test.
- Seismic source testing.
- Outreach.

THE CORE

- Flemmer-1 (east)
- Broom Creek thickness: 263'
- Total sand thickness: 169'
 - Intervals: 53'; 34', 65', 17'
- BNI-1 (west)
- Broom Creek thickness: 273'
- Total sand thickness: 124'
 - Intervals: 89', 19', 16'

INTEGRATION OF SEISMIC DATA

PETROPHYSICAL MODELING

Porosity and permeability

EERC. UND NORTH DAKOTA

- Core analysis: three local wells and two far field wells
- Well logs from the two strat test wells

- Average porosity (%):
 - Reservoir: 26.0
 - Poor reservoir: 12.0
 - Nonreservoir: 5.0
- Average permeability (mD):
 - Reservoir: 315.1
 - Poor reservoir: 6.5
 - Nonreservoir: 0.04

NUMERICAL SIMULATION SCENARIO

Antelope Valley/Dakota Gasification

- Two injection wells
- CO₂ plume
 - 10.5 mi² (25 years)
 - 12.2 mi² (25 years postinjection)

PUBLIC OUTREACH

Foster neutral-to-positive attitudes toward the North Dakota CarbonSAFE project.

- Being factual and objective
- Serving our partners' best interests
- Courtesy and respect of the stakeholders and the community
- Transparent and proactive communication
- Consistent use of key messages

PUBLIC PERCEPTIONS OF CARBON CAPTURE, UTILIZATION, AND STORAGE

Online Survey

- Target audience: residents of Mercer and Oliver Counties
- Postcard notification to every residence in Mercer and Oliver Counties
- In mailboxes ~June 25

• Responses by August 30

Before this survey, had you heard about the process of capturing CO_2 from a power plant and permanently storing it deep underground?

PLEASE INDICATE TO WHAT EXTENT THIS STATEMENT APPLIES TO YOU:

EERC. | UND NORTH DAKOTA

PLEASE CHOOSE THE IMPORTANCE LEVEL FOR EACH RATIONALE TO INVESTIGATE CO_2 CAPTURE AND PERMANENT STORAGE:

REGULATORY AND ECONOMIC ANALYSIS

- Evaluated state permitting requirements for implementation of Class VI injection wells.
- Exploring site access agreement options, pore space acquisition, and short-term project liability.
- Examining specific economic needs and the incentives in place to make the proposed scenarios economically feasible for the project partners.

ILLUSTRATIVE EXAMPLE OF ECONOMIC MODEL OUTPUT – CUMULATIVE NPV vs. PROJECT YEAR

Cumulative NPV Versus Project Year

EERC. | UND NORTH DAKOTA.

SITE DEVELOPMENT PLAN

Create a detailed plan for development of an injection site within the storage complex.

- Site characterization plan
- CO₂ management strategy
- Risk assessment and mitigation strategies

ND CLASS VI PROGRAM COMPONENTS

- Storage facility permit
- Permit to drill for injection well
- Permit to inject
- Certificate of project completion

STORAGE FACILITY CONCEPTS

WELL PRESSURE vs. TIME CONCEPT FOR ACTION

NRAP TOOL EVALUATION

- 1. RROM-Gen (Reservoir Reduced-Order Model Generator) Tool, v.2017.03-1.2.1
- 2. REV (Reservoir Evaluation and Visualization) Tool, v.2017.03-1.2.1
- 3. WLAT (Wellbore Leakage Analysis Tool), v.2016.11-1.0.0.3
- 4. GMPIS (Ground Motion Prediction applications to potential Induced Seismicity) Tool, v.2016.11-1.0.0.3

5. NRAP-Open-IAM (open-source Integrated Assessment Model [IAM]) *BETA release for phase II of the NRAP

SITE-SPECIFIC EVALUATIONS

Our evaluation focused on

NORTH DAKOTA

- Installing and running each tool.
- Using North Dakota-CarbonSAFE data and site-specific stratigraphy.
- Comparing NRAP tool outputs against commercial equivalents, e.g., CMG simulations (where available).
- Initial feedback has already been supplied to NETL/NRAP.

ACCOMPLISHMENTS TO DATE

- Drilled, cored, logged, and plugged the two stratigraphic test wells.
- Retrieved water samples from the target formation.
- Completed laboratory testing of the core.
- Reprocessed legacy seismic data.

NORTH DAKOTA

- Built geologic models and reservoir simulation models.
- Ran multiple scenarios of injection, including stack storage options.
- Monthly outreach advisory board meetings.

ACCOMPLISHMENTS TO DATE

- Held two open house events.
- Conducted public opinion survey on CO₂ storage in the region.
- Held risk assessment workshop.
- Met with state regulators to discuss pore space amalgamation concepts and potential issues.

28

- Began development of broad-scale business case scenarios.
- Reviewed several NRAP tools.

LESSONS LEARNED

- Reclaimed mine land represents a challenge for seismic collection.
- There are great landowners and industrial partners willing to help make a project successful!
- There is tremendous CO₂ storage potential in our area of investigation.
- The benefit of working in a state with Class VI primacy is immeasurable.

SYNERGY OPPORTUNITIES

- We are not working in a vacuum. Other CCUS opportunities in the region are developing.
- Integration with future CO₂ EOR opportunities in the region.

- Contributing to public acceptance of CCUS projects.
- Building a foundation for how states can efficiently permit and oversee commercial-scale CO₂ storage projects.

EERC. | UND NORTH DAKOTA.

PROJECT SUMMARY

- Key findings
 - Superb reservoir properties
 - Internal baffles will aid in storage efficiency.
 - Accepting public attitude
 - Great synergy with commercial endeavors
 - Supportive state regulatory entities
- Next steps
 - Finalize site development plan
 - Finalize economic investigation
 - Complete final report

BENEFIT TO THE PROGRAM

Goals:

- Develop and validate technologies to ensure 99% storage permanence.
- Develop technologies to improve reservoir storage efficiency while ensuring containment effectiveness.
- Support industry's ability to predict CO_2 storage capacity in geologic formations to within ±30%.
- Develop best practice manuals for monitoring, verification, accounting (MVA), and assessment; site screening, selection, and initial characterization; public outreach; well management activities; and risk analysis and simulation.
- To progress toward full-scale carbon capture and storage deployment, the feasibility of a commercial-scale (50+ Mt CO₂) geologic storage complex for CO₂ must be established at one or more of the proposed sites. Activities outlined will gather data to address both the technical and nontechnical challenges associated with establishing feasibility. The results derived from implementation of the project will provide a significant contribution to DOE's Carbon Storage Program goals. Specifically, this project supports DOE Goals 1 and 2 by validating technologies that will improve reservoir storage efficiency, ensure containment effectiveness, and/or ensure storage permanence by collecting and generating fundamental geologic data from the subbasinal characterization of a potentially ideal CO₂ storage complex (Broom Creek Formation). This project also includes efforts to validate risk assessment tools developed by NRAP. Goal 3, the ability to predict CO₂ storage capacity in geologic formations to within ±30%, will be addressed by integrating characterization data derived from the proposed project into geocellular and dynamic reservoir models for a commercial-scale geologic storage complex. In addition, this project supports Goal 4 by producing information that will be useful for inclusion in DOE best practices manuals focusing on monitoring, verification, accounting, and assessment; site screening, selection, and initial characterization; public outreach; well management activities; and risk analysis and simulation.

PROJECT OVERVIEW GOALS AND OBJECTIVES

- Describe the project goals and objectives in the statement of project objectives.
 - How the project goals and objectives relate to the program goals and objectives.
 - Identify the success criteria for determining if a goal or objective has been met. These generally are discrete metrics to assess the progress of the project and used as decision points throughout the project.

PROJECT OVERVIEW GOALS AND OBJECTIVES

- The objective of this project is to determine the feasibility of developing a commercial-scale carbon dioxide (CO₂) geologic storage complex able to store 50+ million metric tons of CO₂ in central North Dakota safely, permanently, and economically. This objective is being met through the evaluation of two project study areas associated with two ideal geologic storage complexes located adjacent to separate coal-fired facilities in North Dakota: The Basin Electric Power Cooperative (BEPC)-owned Dakota Gasification Company (DGC) and the Minnkota-owned Milton R. Young (MRY) Station.
 - Each of the project activities will advance the state of knowledge for conducting commercial-scale CCS projects and provide lessons learned to each of these processes to help ensure the successful development of future commercial-scale projects. Furthermore, the proposed work will contribute directly to achieving DOE's goals of 1) developing and validating technologies that ensure 99% storage permanence, 2) improving reservoir storage efficiency while ensuring containment effectiveness, 3) supporting industry's ability to predict CO₂ storage capacity in geologic formations to within ±30%, and 4) developing best practices manuals.
 - This project is divided into two BPs that correspond to several project milestones. Several success criteria have been developed to help track the progress of the project and to indicate the successful completion of the project's objectives.

Task/ Subtask	Milestone Title	Planned Completion Date	Verification Method
2.2	M1 – Initiation of Well Drilling	11/30/17	Reported in subsequent quarterly report.
2.4	M2 – Completion of Seismic Reprocessing	1/31/18	Reported in subsequent quarterly report.
6.3	M3 – Risk Assessment Workshop Scheduled	2/28/18	Reported in subsequent quarterly report.
3.2	M4 – Identification of Inputs for NRAP Model(s)	9/30/18	Reported in subsequent quarterly report.
3.1	M5 – Completion of Geologic Modeling	10/31/18	Reported in subsequent quarterly report.
6.3	M6 – Updated Risk Assessment Workshop Scheduled	1/31/19	Reported in subsequent quarterly report.

ECONOMIC ANALYSIS MODELING FRAMEWORK – FOUR PROJECT PERIODS

Project Period	Years	Model Components
Project Planning and Preparation	1–5	Costs: Site characterization, baseline MVA, modeling and simulation, project plan, permit acquisition, subcontracts, and CO_2 pipeline(s).
CO ₂ Injection (operations)	6–30	Costs: Capture plant/pipeline CAPEX and OPEX, storage site OPEX, MVA, pore space lease, administrative/trust funds, and 5-year permit reviews. Financial Benefits: 45Q and CO_2 sales.
Postinjection Site Care and Closure	31–40	Costs: Well plugging, pipeline decommissioning, storage site decommissioning, and PISC monitoring.
Certification of Compliance	41	Costs: Certificate of compliance.
