2019 Project Review Meeting for Crosscutting Research, April 9-11, 2019

Program Manager: Vito Cedro III

fengz@ornl.gov
Background: Weld can be the weakest link

- Weldability issues (aka Type IV cracking) in Creep Strength Enhanced Ferritic Steels weldments

HAZ cracking in a 9-12Cr steel

Type IV failure of E911 pipe weldment

Weld

HAZ failure
(at fine grained HAZ)

Source: ETD Ltd.

Abe, F., Kern, T.U. and Viswanathan, R. 2008

- Major reduction in creep strength in the weld region can be as high as 50% of base metal. Effectively negate the benefit of higher creep resistance steels such as P91, P92 etc.

- Lack of reliable predictive modeling tool makes it difficult to effectively incorporate welding technology innovations for creep resistance improvement in design and service. Life assessment of existing power plant and scheduling maintenance and repair

OAK RIDGE
National Laboratory

Degradation of Creep Performance in CSEF Weld

- Not all welds are created equal – it is possible to alter microstructure to improve creep performance of welds

- Weld creep performance assessment tool needs to include microstructure variations and associated different creep deformation/failure mechanisms so that innovations in weld creep performance improvement can be practiced with high confidence

Table: Microstructure evolution at fine grain heat affected zone
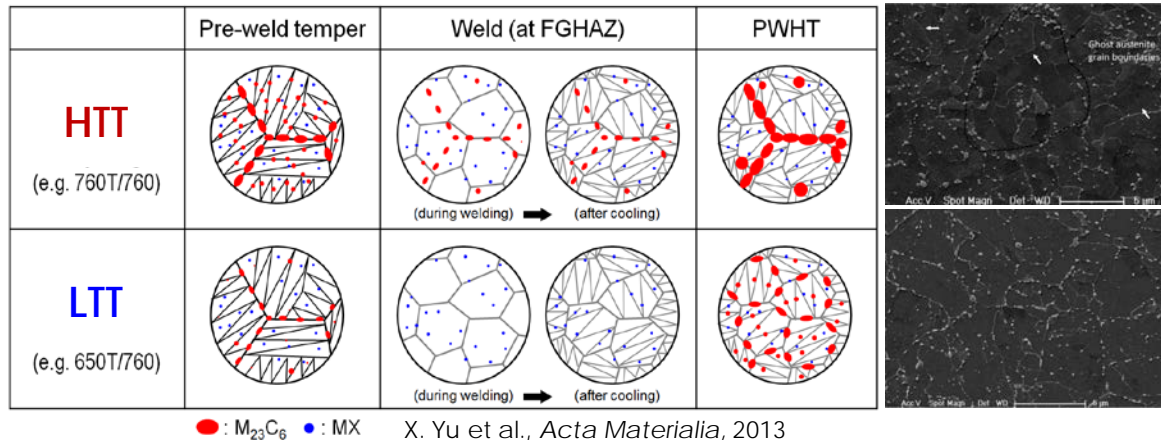

X. Yu et al., *Acta Materialia*, 2013
Project Goal and Scope

- Develop an Integrated Computational Welding Engineering modeling (ICWE) tool for creep deformation and failure in welded structures of Creep Strength Enhanced Ferritic (CSEF) Steels

- Develop a new creep test approach with purposely built system suitable to determine the highly nonuniform creep deformation and failure in the a weldment to validate and refine the model

- Two levels of modeling frameworks have been under development

  - An engineering approach for weld creep performance based on experimental data (Level 1 model)

  - Microstructure informed ICWE model for CSEF steels weld creep performance prediction (Level 2 model)

OAK RIDGE
National Laboratory

What's the local creep behavior in HAZ that controls Type IV cracking in Grade 91 welds?

- Cracking occurs in a very narrow region, typically ~1mm wide
- Measurement needs to have sub-mm spatial resolution
- Standard creep test (for base metal) cannot capture such highly localized creep deformation
P. Mayr, 2007

OAK RIDGE
National Laboratory
A purposely built in-situ full-field creep strain measurement system with high temperature DIC

Creep measurement using "standard" extensometer shows very low creep strain before ternary creep leading to failure

Creep condition:
550 °C, 215 MPa

Level 1 Model: An engineering (phenomenological) approach based on local weld creep measurement

Specially Designed Experiment for in-situ local deformation	→	Structural Performance Model (Creep rate, Creep damage)	→	Weld Creep Performance
- Experimentally determine the local creep strain evolution at different stages of creep deformation and failure
  - High temperature DIC based fully field, in-situ measurement across the entire weld/HAZ region

- Measured properties can be incorporated in constitutive equations or used as direct input in finite element models.
Level 1 Model: Creep Damage Model based on local weld creep measurement

- Physics based phenomenological constitutive equation

$$\dot{\varepsilon}_{ij} = A \sinh\left(\frac{B\sigma_e(1-H)}{(1-\phi)(1-\omega)}\right)\frac{3S_{ij}}{2\sigma_e}$$

$$\frac{dH}{dt} = \frac{h\dot{\varepsilon}_e}{\sigma_e}\left(1 - \frac{H}{H^*}\right)$$ - Strain hardening

$$\frac{d\phi}{dt} = \frac{K_c}{3}(1-\phi)^4$$ - Precipitate coarsening

$$\frac{d\omega}{dt} = CN\dot{\varepsilon}_e(\sigma_I/\sigma_e)^{\nu}$$ - Intergranular cavitation

- Determination of material parameters

Optimization objective function

Genetic algorithm - Matlab

$$f(\varepsilon) = \sum_{i=1}^{n_i}\sum_{j=1}^{m_j}\left[\left(\varepsilon_{ij}^f - \varepsilon_{ij}^e\right)/\varepsilon_{ij}^e\right]^2$$

ε_{ij}^e - Experiment creep strain

ε_{ij}^f - Fitted value of creep strain

n_i - Number of experiment curves

m_j - Number of data points on experiment curves

Level 2 Model: Life Prediction with Explicit Microstructure Information

- What are the key microstructure features for creep deformation?

- How does these key features affect creep properties?

- Due to significant microstructure variations in the weld region, it is essential to explicitly incorporate the microstructure information in creep life prediction

- Such model is also useful to design and optimize microstructure for creep life improvement (base metal and weld metal)

OAK RIDGE
National Laboratory

Level 2 Macroscopic Creep Deformation and Damage Model

- Two Major Parts
  - Creep deformation
    - Grain interior
    - Grain boundary
  - Cavitation failure
    - Cavity nucleation
    - Cavity growth
    - Grain boundary failure
Deformation and Fracture Mechanism Map

Part I: Creep Model - Deformation Mechanisms

- Governing constitutive equation:

Grain interior creep

$$\sigma_{ij,i} + b_j = 0,$$

$$\varepsilon_{ij} = \frac{1}{2}(u_{i,j} + u_{j,i}),$$

$$\dot{\varepsilon}_{ij} = \dot{\varepsilon}_{ij}^{e} + \dot{\varepsilon}_{ij}^{p},$$

$$\dot{\varepsilon}_{ij}^{e} = \frac{1+\nu}{E}\left(\dot{\sigma}_{ij} - \frac{\nu}{1+\nu}\dot{\sigma}_{kk}\delta_{ij}\right).$$

$$\dot{\varepsilon}_{ij}^{p} = \left[A_{\text{dis}}\frac{EbD_{l}}{k_{B}T}\left(\frac{\sigma_{e}}{E}\right)^{n} + A_{\text{coble}}\frac{EbD_{gb}}{k_{B}T}\left(\frac{b}{d}\right)^{3}\left(\frac{\sigma_{e}}{E}\right)\right]\frac{3S_{ij}}{2\sigma_{e}}.$$

where $S_{ij} = \sigma_{ij} - \sigma_{kk}\delta_{ij}/3$, $\sigma_{e} = \sqrt{3S_{ij}S_{ij}/2}$.

Grain boundary sliding

Newtonian viscous flow

$$\dot{u}_{s} = \frac{\Omega\eta_{0}\exp(-Q_{gb}/RT)}{k_{B}T}\tau$$

- Grain orientation effects:

$$f_{\text{tayor}} = \frac{\Sigma\gamma^{\text{local}}}{\langle\varepsilon_{\text{VM}}^{\text{local}}\rangle}$$ -- Indicates "soft" or "hard" grains.

- Crystal plasticity theory
  - Multiplicative decomposition:

  $$\mathbf{F} = \mathbf{F}^{e}\mathbf{F}^{p}$$

  - Plastic deformation rate:

  $$\dot{\mathbf{F}}^{p}\mathbf{F}^{p-1} = \sum_{\alpha}\dot{\gamma}^{(\alpha)}\mathbf{s}^{(\alpha)}\otimes\mathbf{m}^{(\alpha)}$$
- Flow rule   • Hardening law

$$\dot{\gamma}^{\alpha} = \dot{\gamma}_{0}\left(\frac{\tau^{\alpha}}{g^{\alpha}}\right)^{1/m} \qquad \dot{g}^{\alpha} = \sum_{\beta}h_{\alpha\beta}\left|\dot{\gamma}^{\beta}\right|$$

- Modification to the rate equation

$$\dot{\varepsilon}_{ij}^{p} = \left[A_{\text{dis}}\bar{f}_{\text{local}}^{I}\frac{EbD_{l}}{k_{B}T}\left(\frac{\sigma_{e}}{\sigma_{0}}\right)^{n} + A_{\text{coble}}\frac{EbD_{gb}}{k_{B}T}\left(\frac{b}{d}\right)^{3}\left(\frac{\sigma_{e}}{E}\right)\right]\frac{3S_{ij}}{2\sigma_{e}}$$

where $\bar{f}_{\text{local}}^{I} = f_{\text{local}}^{I}/\max(f_{\text{local}}^{1}, f_{\text{local}}^{2}, \dots, f_{\text{local}}^{I}, \dots, f_{\text{local}}^{N})$

OAK RIDGE
National Laboratory

Part II: Creep Fracture and Life Prediction by the Intergranular Creep Fracture Model

Grain interior creep

$$\dot{\varepsilon}_{ij} = \dot{\varepsilon}_{ij}^e + \dot{\varepsilon}_{ij}^p$$

$$\dot{\varepsilon}_{ij}^e = \frac{1+\nu}{E}\left(\dot{\sigma}_{ij} - \frac{\nu}{1+\nu}\dot{\sigma}_{kk}\delta_{ij}\right)$$

$$\dot{\varepsilon}_{ij}^p = \dot{\varepsilon}_0\left(\frac{\sigma_e}{\sigma_0}\right)^n \frac{3}{2}\frac{S_{ij}}{\sigma_e} M$$

where $\sigma_e = \sqrt{\frac{3}{2}S_{ij}S_{ij}}$

M: Micromechanical Taylor factor
** - Grain orientation**

Grain boundary sliding

Newtonian viscous flow

$$\dot{u}_s = w\frac{\tau}{\eta} \ , \ \frac{1}{\eta} = \frac{A}{T}e^{\frac{-Q_s}{RT}}$$
Cavity representation

Cavity volume $\qquad V = \frac{4}{3}\pi a^3 h(\psi)$

Shape parameter $\quad h(\psi) = \dfrac{\left[(1+\cos\psi)^{-1} - \frac{1}{2}\cos\psi\right]}{\sin\psi}$

Smeared–out separation $\quad \dot{u}_n = \dfrac{\dot{V}}{\pi b^2} - \dfrac{2V\dot{b}}{\pi b^3}$
Rate of void spacing

$$\frac{\dot{b}}{b} = \frac{1}{2}(\dot{\varepsilon}_I + \dot{\varepsilon}_{II}) - \frac{1}{2}\frac{\dot{N}}{N}$$

Damage evolution:

$a/b \sim 1.0$

Cavity nucleation, growth and coalescence

Cavity nucleation

Cavitation nucleation rate: $\quad \dot{N} = F_n\left(\dfrac{\sigma_n}{\Sigma_0}\right)^2 \dot{\varepsilon}_e^c$

Nucleation parameter: $\quad S = \left(\dfrac{\sigma_n}{\Sigma_0}\right)^2 \varepsilon_e^c \quad$ for $\sigma_n > 0$

Threshold value: $\quad S_{thr} = \dfrac{N_i}{F_n}$

Cavity nucleation to be triggered: $\ S > S_{thr}$, $N < N_{max}$

Cavity growth

Cavity growth – GB diffusion and creep:

$$\dot{V} = \dot{V}_1 + \dot{V}_2$$

1. Contribution of GB diffusion:

$$\dot{V}_1 = 4\pi D\frac{\sigma_n - (1-f)\sigma_s}{\ln\left(\frac{1}{f}\right) - \frac{1}{2}(3-f)(1-f)}$$

2. Contribution of creep deformation:

$$\dot{V}_2 = \begin{cases} \pm 2\pi\dot{\varepsilon}_e^c a^3 h(\psi)\left[\alpha_n\left|\dfrac{\sigma_m}{\sigma_e}\right| + \beta_n\right]^n, & \text{for } \pm\dfrac{\sigma_m}{\sigma_e} > 1 \\[2ex] 2\pi\dot{\varepsilon}_e^c a^3 h(\psi)[\alpha_n + \beta_n]^n \dfrac{\sigma_m}{\sigma_e}, & \text{for } \left|\dfrac{\sigma_m}{\sigma_e}\right| < 1 \end{cases}$$

OAK RIDGE
National Laboratory
Summary

- A new experiment approach, involving high-temperature creep testing, in-situ DIC measurement, advanced microscopy characterization, and standardized metallurgical analysis, has been developed to investigate creep performance of the CSEF steel welds.

- Localized creep deformation can be quantified by the specially-built DIC, to evaluate creep strength degradation in the CSEF steel welds.
  - The newly formed martensite in ICHAZ during welding has profound influence on the localized creep deformation.

Summary

- Demonstrated an engineering modeling approach (Level 1 model) for weld creep performance prediction based on the local DIC experimental data.
  - Potential for weld process innovation to improve weld creep performance

- Established ICWE modeling framework (Level 2) to simulate effects of key microstructure features and operating conditions (temperature and stress)
  - Capable of predicting creep rapture life of base metal and welds in literature
  - Demonstrated the feasibility of a micromechanics RVE model to provide microstructure informed constitutive relation for macroscopic weld structure performance prediction.

OAK RIDGE
National Laboratory

On-Going Work

- Additional experiments with varying key microstructure constituents in the HAZ of P91 weld to provide needed parameters to validate the model and make it applicable to specific CSEF materials and welds.

- Refine/fine turn the modeling approach to better connect microscopic RVE and macroscopic models

- Port the ICWE code to high performance computers (HPC) for realistic prediction of industry applications

OAK RIDGE
National Laboratory

Thank you!

ORNL is managed by UT-Battelle, LLC for the US Department of Energy

Key Milestones

- FY2015
  - Improve and standardize the ORNL weld creep test procedure and demonstrate its effectiveness to quantify the non-uniform creep deformation behavior in P91 weldments
- FY2016
  - Complete first stage of microstructural model with consideration of martensite/precipitates evolution and interaction
  - Develop a weld creep performance model using experimental determined creep parameters (Level 1)
- FY2017
  - Complete integration of microstructure model with RVE model (Level II)
- FY2018
  - Demonstrate the model developed in this project for creep life prediction
  - Report on the feasibility and potential of big data and deep learning method for creep life prediction of weldments
- FY2019
  - Complete integration of microscopic RVE with evolving microstructure features and macroscopic models for component level predictions (March 2019)
  - Port the ICWE code to high performance computers (HPC) for realistic prediction of industry applications (June 2019)
  - Complete purposely designed experiments with varying microstructures to support and validate the ICWE model (Sept. 2019)
