Advanced Sensors & Controls FWP

Overview

Michael Buric, Dustin McIntyre, Yuhua Duan, Dan Haynes, David Tucker, Erik Shuster, Joe Yip, Jeff Wuenschell, Dan Hartzler, Chet Bhatt, Juddha Thapa, Nari Soundararajan, Subha Bera, Yan Zhou, Nick Park, Swarom Kanitkar, Jennie Stoffa, Steve Richardson, Jerry Carr

Presenter: Ben Chorpening, TPL

**Adapting to Changing Role**

Fossil energy power generation is needed now and in the future, but its role is shifting from baseload operation to fulfilling dispatchable power needs in regions of the United States.

*Novel sensors and controls will help to increase efficiency, minimize emissions, and reduce operating costs of existing power generation technologies under this increased load following role; and help enable next generation power systems with high efficiency and greater operational flexibility.*

Data from Texas (ERCOT)

Renewable power production often does not match demand.
Sensors & Controls Development for Harsh Environments

Gasification
- Radically engineered modular systems for gasification
- 1100 - 1500°C
- Meas. Challenges
- Multipoint temp
- Species
- NDE of adv. manuf. components
- Multiphase flow

Coal-fired Boilers
- Steam 1110°F (600°C), 4000 psig
- Fire side 2500°F (1370°C)
- Ash / slag / SOx
- Meas. Challenges
- Tube temperatures / flow (cycling)
- Corrosion/erosion/exfoliation
- Steam chemistry
- Coal particle size
- Temperature / species dist. Inside boiler

Subterranean chemistry monitoring
- High pressure brine
- Meas. Challenges
- Salts in water
- Wellhead measurement
- Downhole measurement

Chemical Loopsing
- > 1000°C
- Pressurized
- Erosive
- Meas. Challenges
- Solids circulation
- Oxidation state
- Multipoint temp
APPLIED MATERIALS SCIENCE & ENGINEERING
Developing and deploying affordable, high-performance materials designed for severe service applications.

DECISION SCIENCE & ANALYSIS
Utilizing multi-scale computational approaches to provide in-depth objective analyses in support of the DOE mission.

SYSTEMS ENGINEERING & INTEGRATION

CHEMICAL ENGINEERING
Pioneering efficient energy conversion systems that can enable sustainable fossil energy utilization.

SUBSURFACE SCIENCE
Enabling the sustainable production and use of fossil fuels through engineering of the subsurface.

Accelerating technology innovation, development and deployment to enable new clean energy technologies to gain market acceptance.
Technology Development Pathway

An Active Portfolio from Concept to Market Readiness

- **DISCOVERY**: Concept identified/proven at laboratory-scale
- **DEVELOPMENT**: Technology component validated/integrated
- **SYSTEM TESTING**: System performance confirmed at pilot-scale
- **DEMONSTRATION**: System demonstrated in operational environment
- **COMMERCIALIZATION**: Technology available for wide-scale market use

**RIC focus**

**TECHNOLOGY MATURATION**

- **Scale**
- **Technology Confidence**
- **Investment**
- **Private Sector Cost Share**
Overview of Adv Sensors & Controls FWP

- **Sensors and Instrumentation**
  - High temperature optical fiber sensors (Tasks 21-25, 32, 33)
  - SAW sensors for gas sensing (Task 26)
  - Raman Gas Analyzer (Task 41)
  - LIBS for Subterranean Chemical Sensing (Task 71)
  - In-Situ Temperature Measurements via Reactive Particles (Task 47)

- **Controls**
  - Agent-Based Controls for Power Systems (Task 51)

- **Techno-Economic Analysis**
  - TEA of Sensor and Control Technologies (Task 64)

- **Cybersecurity and Novel Concepts**
  - VLC – Alternative to WiFi (Task 81)
  - AI-based approach for screen and design of funct. materials for harsh env. (Task 86) new
  - Quantum sensors for fossil energy (Task 87) new
Developing materials and sensing approaches to develop a fiber-based sensing concepts that can provide spatially resolved chemical species and temperature measurements from an optical fiber at above 800°C.

Functional nanomaterials

Material modeling

LHPG system

Commercial and novel multipoint interrogation

Fossil energy relevant gases

Optical Fiber Sensing for Harsh Fossil Energy Applications
Multipoint Boiler Tube Temperature Monitoring

- Measure temperatures from every tube
  - Expected spatial resolution 1 inch (200 ft long)
  - Identify local hot spots on tube wall
  - Spot maldistribution of steam flow at low power
  - Gold-coated silica fiber possible: <1200°F (650°C), air
  - Other application locations possible

Apply commercial optical fiber readout instrument (silica fiber)
Task 32. Field Demonstration of Distributed Temperature Measurement with Optical Fiber for Fossil Energy Power Generation Applications

- Preparations were completed for a pilot-scale field test of distributed temperature sensing
  - gold coated SMF fiber 5 meters long
  - pilot scale pulverized coal combustion unit at University of North Dakota Energy and Environmental Research Center (UNDEERC)
- Dry run of installation and testing in NETL laboratory
  - Installation of the gold-coated fiber into a 1/8 inch stainless steel tube for protection
  - Included mechanical connection to a 30 meter section of ordinary silica fiber which will be needed to reach the control room at UNDEERC
  - Tested through several temperature cycles up to 600°C using the plate heater apparatus to check the temperature sensing performance in comparison with thermocouples
  - Custom postprocessing of data necessary to obtain accurate temperature readings at the higher temperatures
  - LabVIEW program developed to automatically post process
- Pilot scale test on hold due to COVID-19
Fast Raman Gas Analyzer

- Applications to **power generation** and **chemical process control**
- Prototype tested in pilot scale laboratory applications
- Fast - 1 second measurement time
- Species concentrations measured to 0.1%
- Optical waveguide technology boosts Raman signal more than 1000X
- No recalibration needed in normal operation
- Seeking collaborative partners or licensees

*No commercial technology has this combination of speed, accuracy, and multi-gas capability.*

Raman Spectroscopy of Gases

All major species simultaneously (no noble gases)

Measures difficult gases: H$_2$, N$_2$, O$_2$ (they have no IR transitions)

Easily distinguishes CO from N$_2$ (difficult for mass spectrometer)

Operates at process pressure
Task 41. Raman Gas Analyzer Field Testing and Development

- Continue technical maturation and field testing of the RGA, an NETL developed, fast, on-line instrument that measures gas composition for smarter combustion, gasification, and industrial process operation

- Also applicable to fuel reforming and hydrogen production

- 1000 psi
- Design for NEC Class 1 Div 2

Data from test at turbine OEM, showing fast response to composition change in NG fuel blend (with hydrogen)
Task 47. In-situ Temperature Measurements via Reactive Particles

- Developing multilayer particles for injection into boiler with coal
- Temperature to be mapped from reaction pattern
- A simplified testing apparatus was developed to assess the green light emission from pyrotechnic core formulations
- Synthesized, characterized, and tested 15 different pyrotechnic formulations
  - Compositions contained a mixture of metallic fuel, oxidant, color source, and binder
- Bright green color was obtainable with BaCl$_2$ colorant, high oxidant (KClO$_4$) to fuel ratio (3:1), and any metal fuel tested (Mg, Co, or Sn)
  - Light from the formation of BaCl$^+$ radical in gas phase
  - Boric acid and copper sulfate are other potential sources of green light
- Performing dip-coating studies for the application of the protective layers
  - Used Mg spheres as representative substrate for inner core
  - Needed to control reaction location of particles
• Goal: Improve boiler operation at varying loads.
• Objective: Provide a laser-based measurement of species and/or temperature inside a coal-fired boiler or HRSG along a line of sight with spatial resolution better than 1 meter and a single point of access.
Task 51. Development and Testing of Agent-Based Controls for Power Systems

- **Objective:** Develop and test the suitability of agent-based controls for power plant applications
  - Benefit is in applications where the link between actuation and result is difficult to model
- Through discussion with PacificCorp, the coal pulverizer subsystem has been identified as having the potential to benefit from improved controls for more flexible operations
- Agent-based controls applied to the hot air and cold air input streams will provide improved control of temperature in the coal pulverizers during off-design operations and load ramping

Model-Free Control (Agent-Based)

- Reconfigurable on different power plants
- Multi-agents emulate intelligent control
- Agents can coordinate their behavior to achieve multiple objectives
- Load following was achieved while minimizing the transient impact on efficiency

Data from turbine speed control experiment utilizing two co-worker agents and two actuators that are fully closed (i.e., saturated) at nominal conditions, performed in the Hyper facility, using a real turbine.

Design of a cyber-physical system emulation of a power plant, focusing on the temperature control of the pulverizer air temperature using two actuators, similar to the Hyper demonstration.
Task 71. Development of LIBS for Subterranean Sensing

- Objective: Development, optimization and testing of a deployable miniaturized LIBS system for subterranean chemical sensing.
- A miniaturized submersible measurement probe was recently completed.
- Laboratory bench experiments have shown the ability of this new probe to measure several elemental species in solution.
- Field use of this device will require the construction of a laser safety shield/interlock system for outdoor use.
- This task will address these remaining issues and begin field testing with the NETL-designed miniaturized submersible measurement probe.
Task 64. TEA Analysis: Forced Outages for Coal-Fired Power Boilers

Average annual forced outage hours for coal-fired units (2013–2017)

- **Source:** NERC GADS PC GAR-MT,
Focus on outages due to boiler problems – causes, sensing, tech gaps

Boiler outage cause codes from EV / GADS data

- Fuel supply bunker to boiler
- Piping system
- Internals and Structure
- Slag/Ash removal
- Tube leak
- Fireside slagging/ fouling
- Misc tube problems
- Air and Gas system
- Control system
- Overhaul and inspections
- Water condition
- Design limitation
- Misc boiler

Tube leaks cause forced outages for coal boilers at more than 10x the rate of next highest failure.
Task 86. Machine Learning-Based Theoretical Approach for Screening and Design of Functional Materials for the Harsh Environment Applications

- Establishing a machine learning-based model architecture to boost the development of gas sensor materials that function in harsh environments: challenges:
  - Lack of systematic approach to predict sensing properties of material candidates other than at ambient conditions
  - Machine learned prediction of the response signals for sensing materials at various operating conditions; specifically at high temperature

- Initiated to build a database of sensor materials: Material Bank
  - Currently setting up a list of materials applicable as optical gas sensors; mainly focusing on metal oxides and perovskites
  - Data mining the mechanic/electronic/optical properties for the materials in the list will be conducted using “Materials Project” (open access web database)
  - Unavailable physical properties from Materials Project and other resources will be calculated, and will be combined with collected properties
  - Material bank will be finalized to proceed for machine learning prediction
Task 87.0: Quantum Sensing for Fossil Energy Applications

- **Objective:** Use quantum sensing materials, quantum optics, quantum computing, and quantum sensing methodologies for realizing unprecedented performance in advanced sensing instrumentation for high priority FE applications, with at least an order of magnitude improvement as compared to classical counterparts within acceptable costs.

- **Review of QIS relevant to FE complete, submitting for publication**
