PROJECT OBJECTIVE & DESCRIPTION

OBJECTIVE

Align with DOE's Fossil Energy Objective to create innovative solutions that integrate physics-based models with data-driven analytics and machine learning techniques to improve coal fired power plant operations

(DE-FOA-0001989 Topic 3A)

DESCRIPTION

New technology is developed to integrate an existing heat-balance modeling product with an existing advanced pattern recognition, machine learning and artificial intelligence product to create a hybrid online monitoring solution

- Completed solution is demonstrated at a utility-owned coal fired plant
- New Technology Elements are taken from TRL 2 to TRL 7

IMPROVING POWER PLANT OPERATIONS

ENABLING EARLIER INTERVENTION TO PREVENT PROBLEMS

Improve Equipment Reliability

- Early detection of equipment issues
- Higher equipment availability
- Insights into issue causes
- Estimate of remaining time to act

Improve Process Performance

- Early detection of performance issues
- Enhance/maintain optimal performance

Improve Plant Flexibility

- Expand operating envelope to accommodate renewables
- Safe and compliant transients

TYPICAL UTILITY M&D CONFIGURATION

SEPARATE PERFORMANCE AND RELIABILITY TEAMS / PRODUCTS

Performance

Reliability

First Principles Methods

- Thermal analysis & heat balance models
- Generally focused on performance
- Anomaly detection limited by model fidelity

Advanced Pattern Recognition (APR)

- Generally focused on reliability
- Good at detecting small changes
- Uses mostly measured values

Diagnostics

- 1st principles can provide insight on cause
 - Simple IF/THEN rules
- Rarely used, even if available

Prognostics

- Generally, NO prognostics available
 - Single parameter trending (vibration)

NEW HYBRID ANALYTICS SOLUTION

INTEGRATION OF TWO PROVEN TECHNOLOGIES

- **SureSense® Software**
 - Advanced pattern recognition (APR) and machine learning
 - Online problem detection and alerting
 - Automated AI diagnostics and remaining time to act estimates
- **Broad power generation user base**
 - Over 50GW of power assets monitored
 - Coal, nuclear, gas/CC, hydro & renewable
 - Comprehensive IT integration

- **MapEx Software**
 - Detailed heat balance analysis
 - Online data reconciliation
 - Equipment performance analysis
- **Led by Dr. Rodney Gay**
 - Original developer of GE GateCycle
 - (acquired by GE in 1999)
 - Author: "Power Plant Performance Monitoring"
- **Installed at more than 25 sites globally**

HYBRID HB/APR MODELS

COMBINE ADVANTAGES & REMOVE LIMITATIONS

HEAT BALANCE MODEL

Advantages

- Based on physics of process
- Calculates values not directly measured
- Can use model to explain cause
- Includes upstream & downstream impacts
- Can model infrequent operating conditions

Limitations

- Difficult to setup & configure
- Less accurate predictions
- Sensitive to model & sensor errors
- Limited anomaly detection

APR (DATA-DRIVEN) MODEL

Advantages

- Very easy to setup & configure
- More accurate predictions
- Highly sensitive anomaly detection
- Detects all types of abnormal behavior
- Learns historical relationships

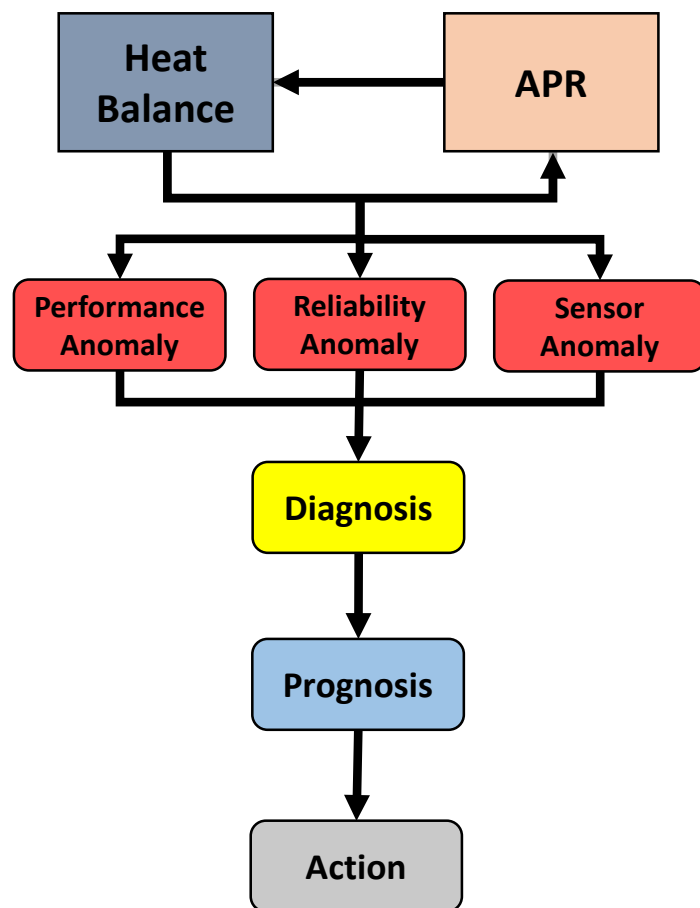

Limitations

- Normal state defined by training dataset (operating envelope)
- No inherent basis to explain cause
- No consideration of upstream or downstream impacts

Hybrid Analytics Solution

Improving Performance & Reliability

- **Heat Balance (HB) Methods**
 - Calculates “virtual” sensor information
 - APR models “calibrate” HB models
- **Advanced Pattern Recognition (APR)**
 - Uses both measured and calc HB data
 - Compares *Current State* to *Normal State*
- **Advanced Anomaly Detection**
 - Early and accurate anomaly detection
- **Online Diagnostics**
 - Rules-based **PLUS** model-based
 - Use symptoms from both HB and APR
 - Considers upstream/downstream info
- **Online Prognostics**
 - Calculates remaining time to act
 - Automatically updates with new information

HYBRID MODELS DETECT PROBLEMS SOONER

MODEL RESIDUALS ARE MINIMIZED FOR NORMAL BEHAVIOR

Heat balance models have modeling error/noise that makes it difficult to clearly detect an anomaly through the "normal" noise or variance.

Data-based APR models have lower "normal" residuals & therefore can detect anomalies easier & earlier.

Hybrid models (APR+Heat Balance) have the lowest residuals and most accurate anomaly detection

RESIDUAL DISTRIBUTION COMPARISON

HYBRID MODEL HAS BEST RESIDUAL DISTRIBUTION

HYBRID MODEL

- Less Bias (lower mean)
- Lower Standard Deviation

BENEFITS

- Tighter Thresholds
- More Sensitivity
- Earlier Detection
- Fewer False Alarms

CURRENT STATUS OF PROJECT

FOUR TECHNICAL TASKS (MONTH 18 OF 24)

Develop & Integrate Physics-based Models

- MapEx HB modeling engine rewritten as SureSense plug-in
- MapEx user interface plugin for SureSense in progress

Develop & Integrate Hybrid-Analytics Framework

- First generation MapEx HB modeling engine integrated
- Iterative analytics framework completed

Verify Hybrid- Analytics Solution

- Agile development and test sprints ongoing
- Framework elements deployed at customer sites for user feedback

Demonstrate Hybrid Analytics Solution

- Coal-fired boiler and steam system heat balance model in progress for utility site demonstration testing

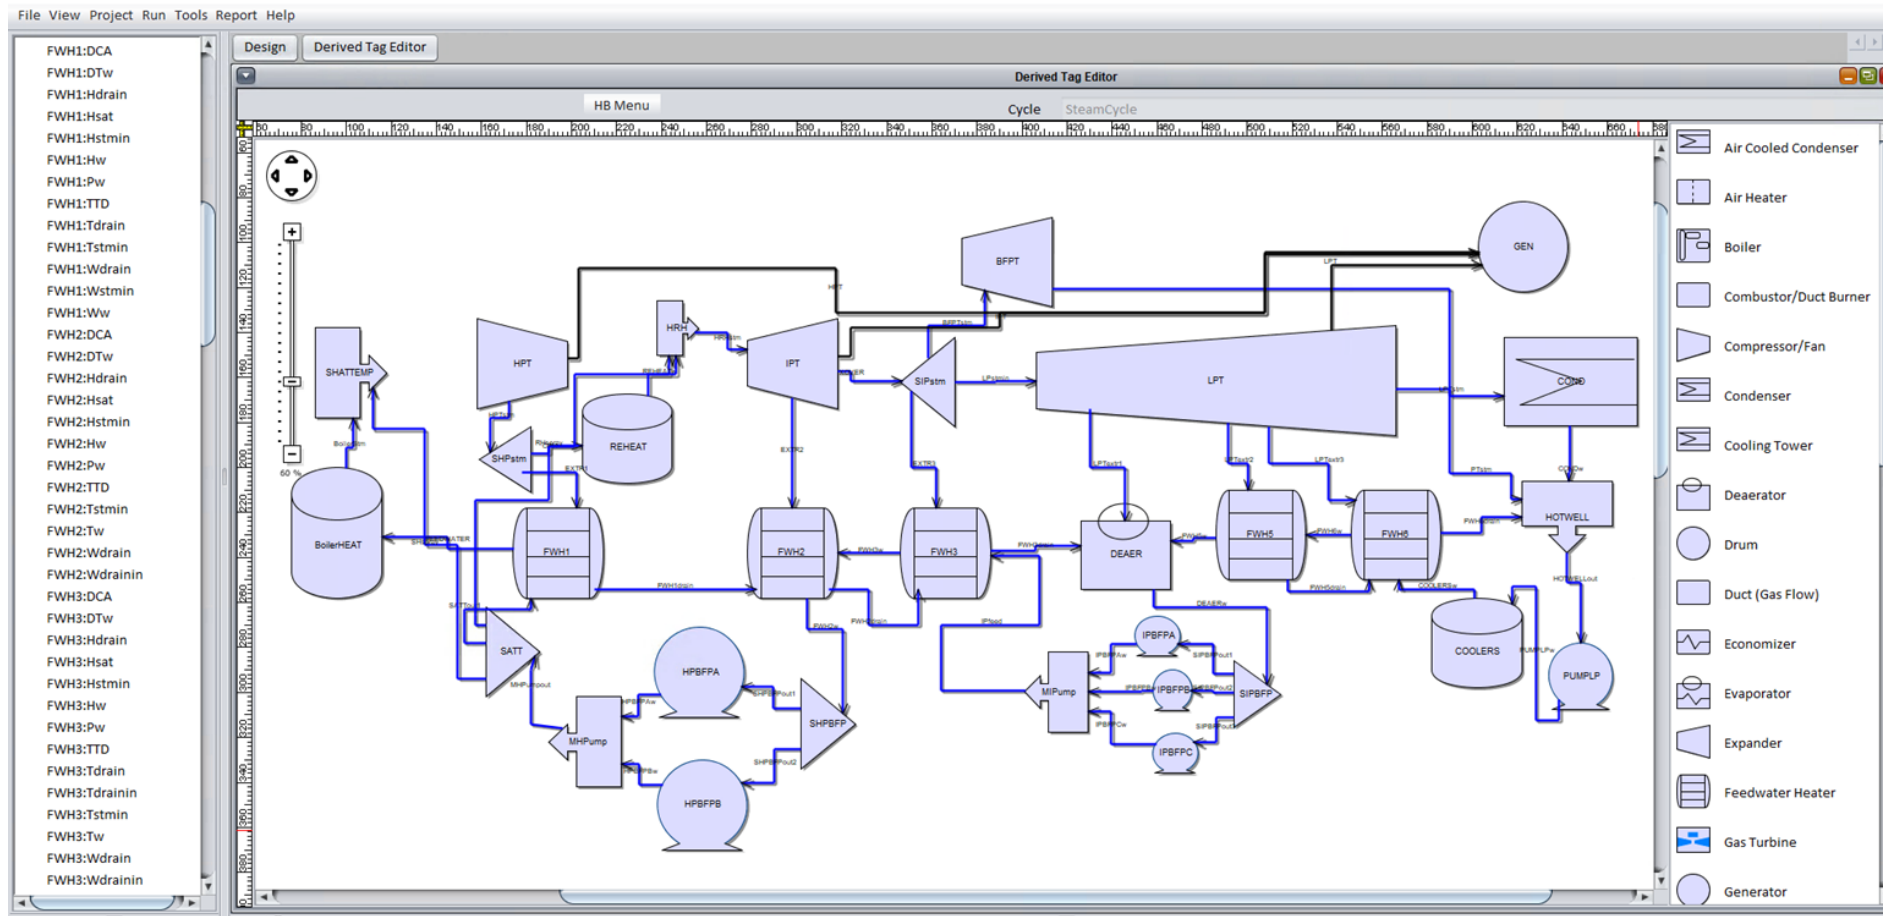

UTILITY SITE DEMO ARCHITECTURE

INPUT – OUTPUT MAPPING EDITOR

The screenshot displays the 'MapEx model plugin' interface. It features a 'Variables and Measurements' list on the left, a 'Variable Details' dialog box in the center, and a 'TagValue' table on the right.

Variables and Measurements:

Variable	Description
Power	Stage Group Power
Pratio	Pressure Ratio
Pstmo	Steam Outlet Pressure
Pstmin	Main Steam Inlet Pressure
Pstmin1	Admission 1 Pressure
Pstmin2	Admission 2 Pressure
Qstm	Steam Outlet Quality
Text1	Extraction 1 Temperature
Text2	Extraction 2 Temperature
Text3	Extraction 3 Temperature
Text4	Extraction 4 Temperature
Text5	Extraction 5 Temperature
Tstm	Steam Outlet Temperature
Tstmin	Main Steam Inlet Temperature
Tstmin1	Admission steam 1 Temperature
Tstmin2	Admission steam 2 Temperature
Wextr1	Extraction 1 Mass Flow Rate
Wextr2	Extraction 2 Mass Flow Rate
Wextr3	Extraction 3 Mass Flow Rate
Wextr4	Extraction 4 Mass Flow Rate
Wextr5	Extraction 5 Mass Flow Rate
Wstm	Steam Outlet Mass Flow Rate
Wstmin	Main Steam Inlet Mass Flow Rate
Wstmin1	Admission steam 1 Mass Flow Rate
Wstmin2	Admission steam 2 Mass Flow Rate

Variable Details (Tstmin):

Name: Tstmin
Description: Main Steam Inlet Temperature
Var Type: Measured
BFV: Believe
Uncertainty: 0.01
Tag Name: THROTTLE STM TEMP [DEG F]
Tag Value: 1000.9
Tag Units: DEG F
Measured: 1000.9
Value: 1000.9
Units: F
Heat Balance: 1000.9
Results Units: F
Out Tag Name:
Minimum: 0.0
Maximum: 0.0
Reference: 0.0
Report Level: 3

TagValue Table:

TagValue	Value	Units
0	150.528	MW
0	3.98	Fraction
565.6	580.3	psi
2,295	2,309.7	psi
0	0	psi
0	0	psi
0	179.821	%
0	483.673	F
0	0	F
0	0	F
0	0	F
0	0	F
653.2	653.2	F
1,000.9	1,000.9	F
0	0	F
0	0	F
0	0	lb/sec
0	0	lb/sec
0	0	lb/sec
0	0	lb/sec
0	0	lb/sec

0	0	lb/sec
0	0	lb/sec

Connect real-time plant data to the MapEx model plugin

Model adjusts to use the available input tags

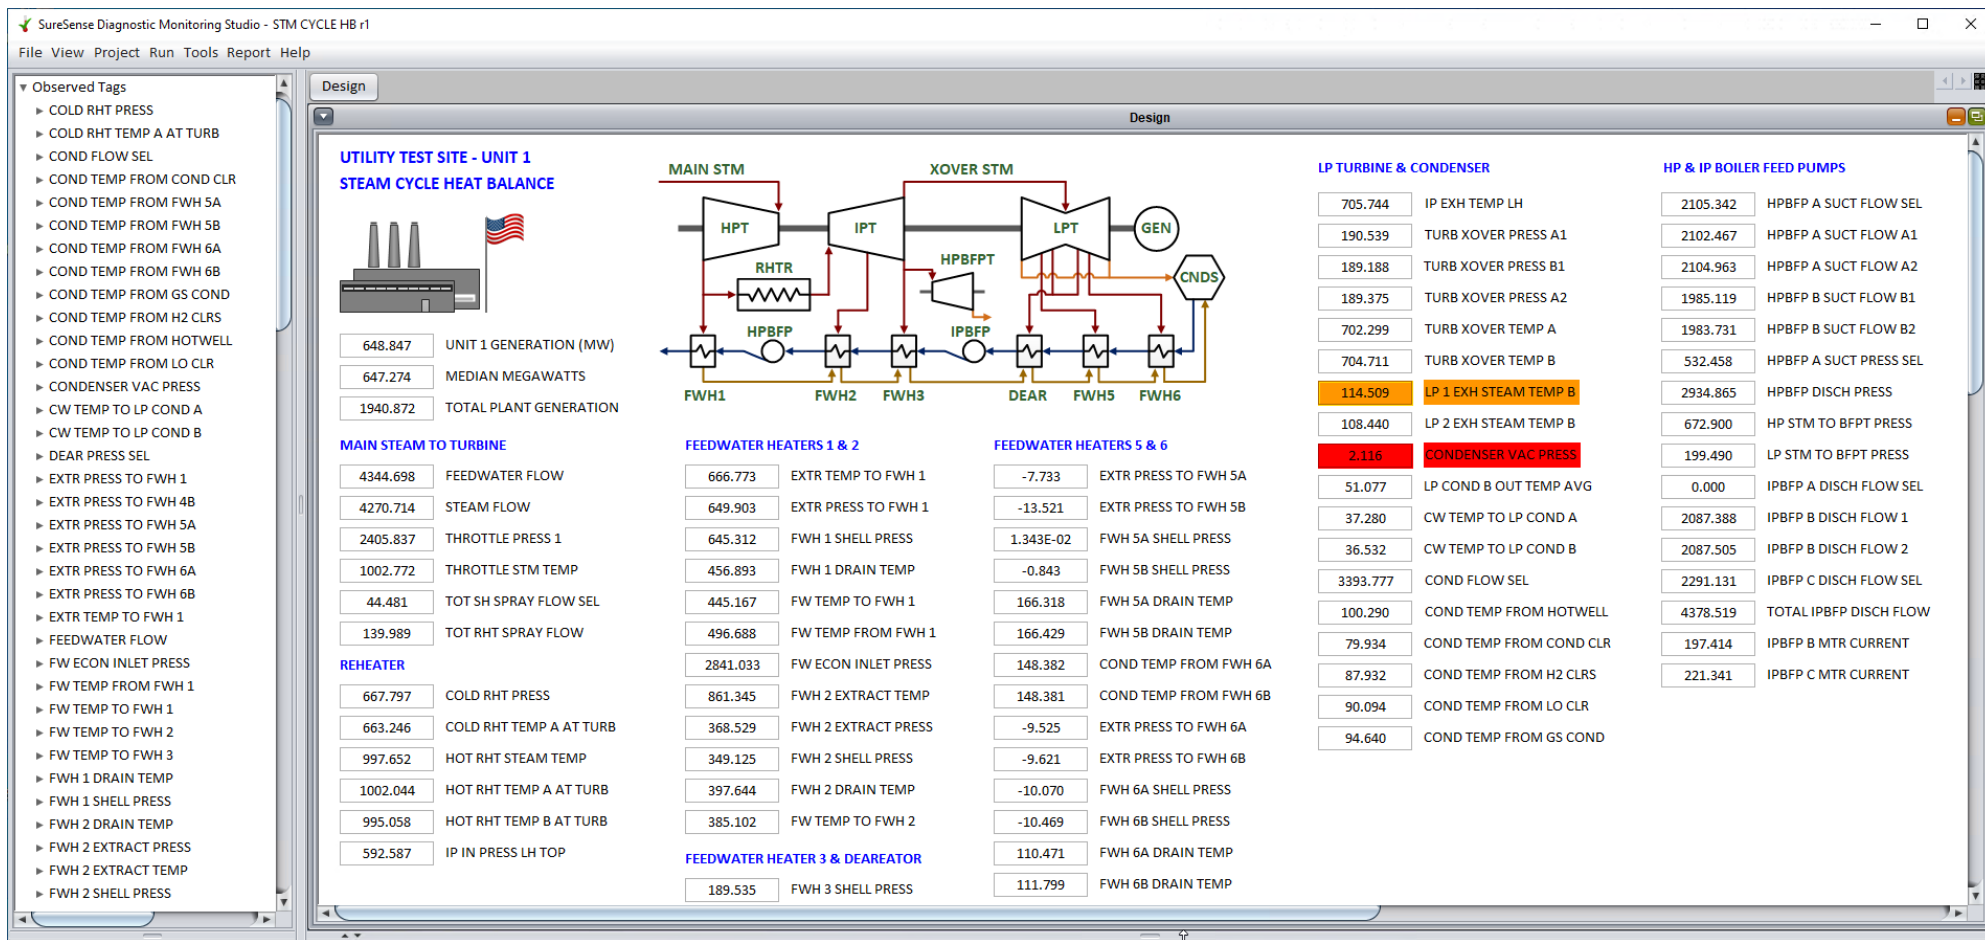

Heat Balance outputs are available as SureSense derived tags

Available for use in data-driven models, diagnostics & prognostics

Calculated Fuel Moisture Content

FUTURE GOALS AND OPPORTUNITIES

- **The Hybrid Analytics Platform** offers an unprecedented opportunity to automate diagnostics and remaining life prognostics for all types of power generation equipment
- **Model-Based AI Methods** can learn complex diagnostic relationships and capture subject matter expertise
 - Probability-based decision graphs (belief networks)
 - Ideal for complex & multi-symptom failure modes
 - Use performance AND reliability symptoms for holistic diagnosis
 - Use upstream and downstream symptoms for diagnosis
