

## Carbon Management and Oil and Gas Research Project Review Meeting

# Coupled Hydrologic, Thermodynamic, and Geomechanical Processes of Natural Gas Hydrate Production (FWP-72688)

August 25, 2021

**Mark White, Ph.D., P.E.**

Staff Engineer, Energy and Environment Directorate  
Pacific Northwest National Laboratory

PNNL is operated by Battelle for the U.S. Department of Energy

# Budget Period 1 Tasks

## BP1-Task 1.0 Project Management and Collaborative Research

Collaborative project with KIGAM via the Joint Korea-U.S. Gas Hydrate Project

KIGAM research directed at innovative production technologies for suboceanic deposits of gas hydrates, such as those found in the Ulleung Basin of the Korean East Sea

## BP1-Task 2.0 IGHCCS2

PNNL will participate in the 2nd International Gas Hydrate Code Comparison Study (IGHCCS2) as both participant (i.e., submitting solutions) and co-lead. The other co-leaders for this code comparison study will be Tim Kneafsey from Lawrence Berkeley National Laboratory and Yongkoo Seol from the National Energy Technology Laboratory. The study will be particularly focused on modeling coupled thermal, hydrological, and geomechanical processes and their effect on the production of methane gas from hydrate-bearing reservoirs. This study will build on the accomplishments of 1st International Hydrate Code Comparison Study (IHCCS-1), successfully executed from 2007 to 2009, and consider the expanded number of numerical simulators worldwide and advances in modeling capabilities of those analytical tools.

# Budget Period 2 Tasks

## BP2-Task 1.0 Project Management and Collaborative Research

Collaborative project with KIGAM via the Joint Korea-U.S. Gas Hydrate Project

KIGAM research directed at innovative production technologies for suboceanic deposits of gas hydrates, such as those found in the Ulleung Basin of the Korean East Sea

## BP2-Task 2.0 Simulations in Support of the Alaska North Slope Project

Numerical simulations to forecast the performance of the production test well of the joint NETL-JOGMEC-USGS-AIST Alaska North Slope (ANS) project, during a series of depressurizations, over the intrinsic permeability, relative permeability, and bound-water parameter space.

Additional simulations to forecast the response of the system to gas injection into the monitoring wells, following a period of depressurization.

## BP2-Task 3.0 Well Model Implementation in STOMP-HYDT-KE

Implementation of a well model similar to those developed for STOMP-CO<sub>2</sub>, STOMP-EOR, and STOMP-GT for deviated wells in STOMP-HYDT-KE.

# Budget Period 3 Tasks

## BP3-Task 1.0 Project Management and Collaborative Research

Collaborative project with KIGAM via the Joint Korea-U.S. Gas Hydrate Project

KIGAM research directed at innovative production technologies for suboceanic deposits of gas hydrates, such as those found in the Ulleung Basin of the Korean East Sea

## BP3-Task 3.0 STOMP-HYDT-KE Parallelization

PNNL will develop a parallel implementation of STOMP-HYDT-KE using MPI. MPI allows for parallel processing on shared memory (i.e., single nodes with multiple processors) and distributed memory computers (i.e., multiple nodes with multiple processors per node). The development involves converting the existing sequential implementation (i.e., single-processor) computer code into a parallel implementation. Ghost cells will be used to transfer information across processors and call parallel processing calls will be MPI based. This conversion will follow the framework and processes proven successful for developing parallel implementations of STOMP-GT and STOMP-CO<sub>2</sub>, but will not use Global Arrays calls. Those calls will instead be converted to MPI calls. To take full advantage of this implementation, STOMP-HYDT-KE will be linked to PETSc, the modern standard for parallel linear system solvers.

# Sequential and OpenMP Implementations of STOMP-HYDT-KE

## Solved Conservation Equations

energy

water mass

mobile mass of  $\text{CO}_2$ ,  $\text{CH}_4$ ,  $\text{N}_2$

hydrate mass of  $\text{CO}_2$ ,  $\text{CH}_4$ ,  $\text{N}_2$

inhibitor mass (e.g., salt)

## Active Phases

aqueous

gas

nonaqueous liquid

gas hydrate

ice

precipitated inhibitor

solid

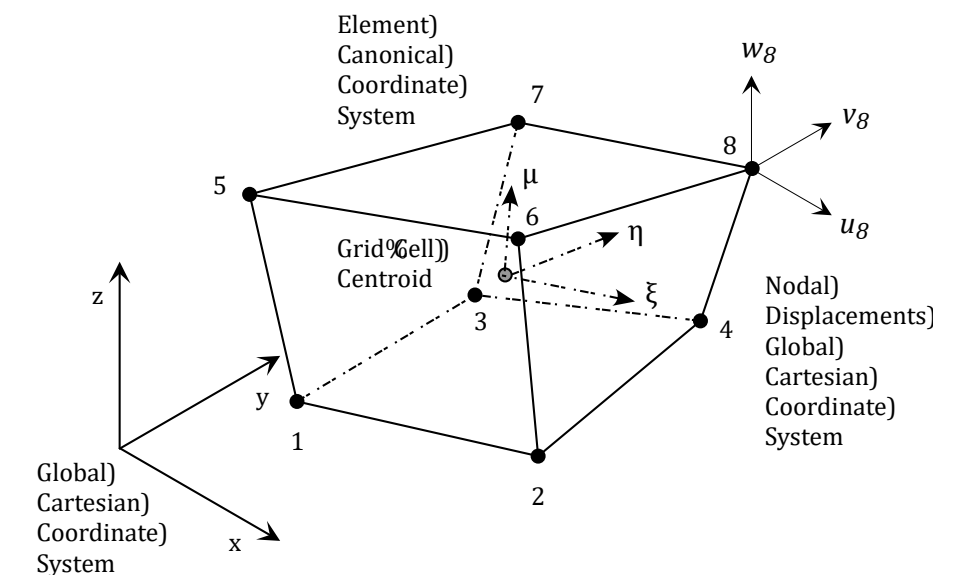

## Fully Coupled Solvers

ECKEChem (geochemistry)

- finite volume
- operator split
- Courant number limiting

GeoMech (geomechanics)

- finite element
- hexahedron elements
- linear elastic
- static
- poroelasticity
- thermal expansion
- fixed-stress iterative sequential coupling

# Legacy Code Parallelization – Sequential and OpenMP Implementations

## ASCII (text) Input Files

input (problem description)

tertiary mixture phase envelope ( $\text{CO}_2\text{-CH}_4\text{-N}_2$ )

tertiary mixture gas hydrate equilibria ( $\text{CO}_2\text{-CH}_4\text{-N}_2$ )

## Fortran 90 w/ or w/o OpenMP Source Code

preprocessor to determine required memory

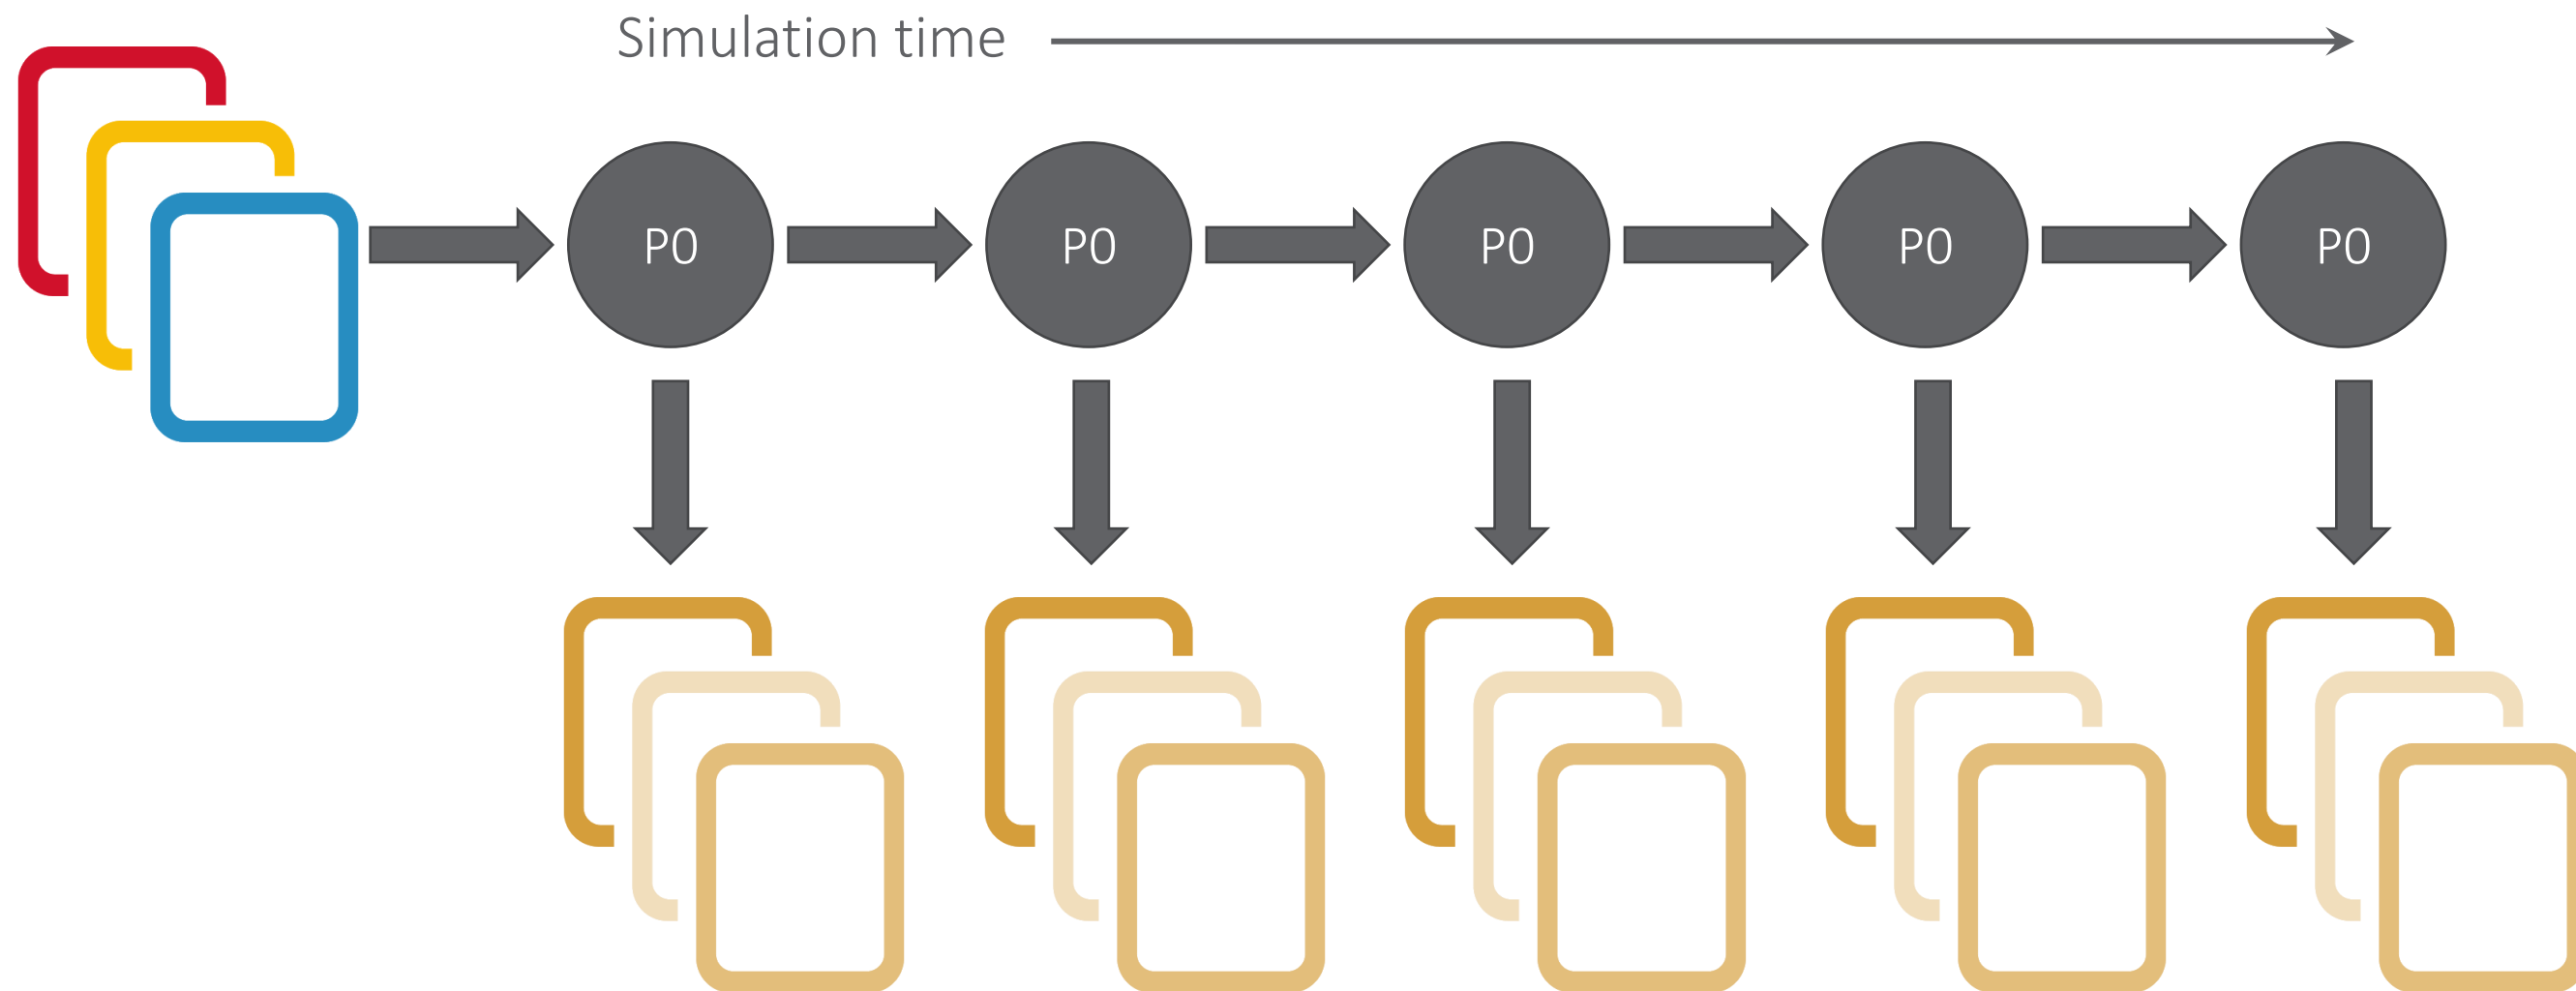

dynamic memory allocation

sequential looping over all field nodes (i.e., grid cells)

parallel looping over all field nodes (i.e., grid cells) via shared memory

coupled to a sequential or OpenMP external solver

# Legacy Code Parallelization – Sequential Implementation

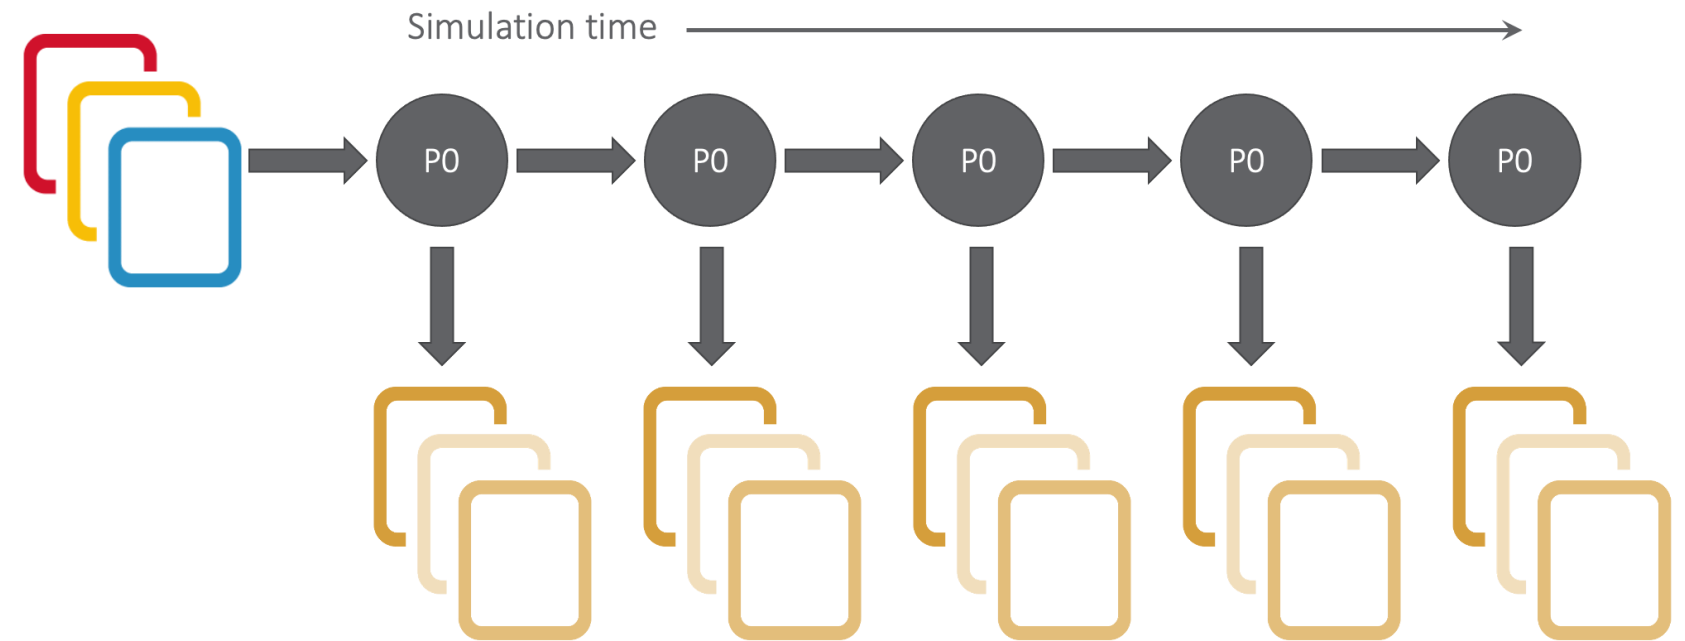

# Legacy Code Parallelization – Sequential Implementation

## Pros

- Convenient screen output
- ASCII input and output files
- Multiple core computers not required

## Cons

- Sequential performance
- Idle cores

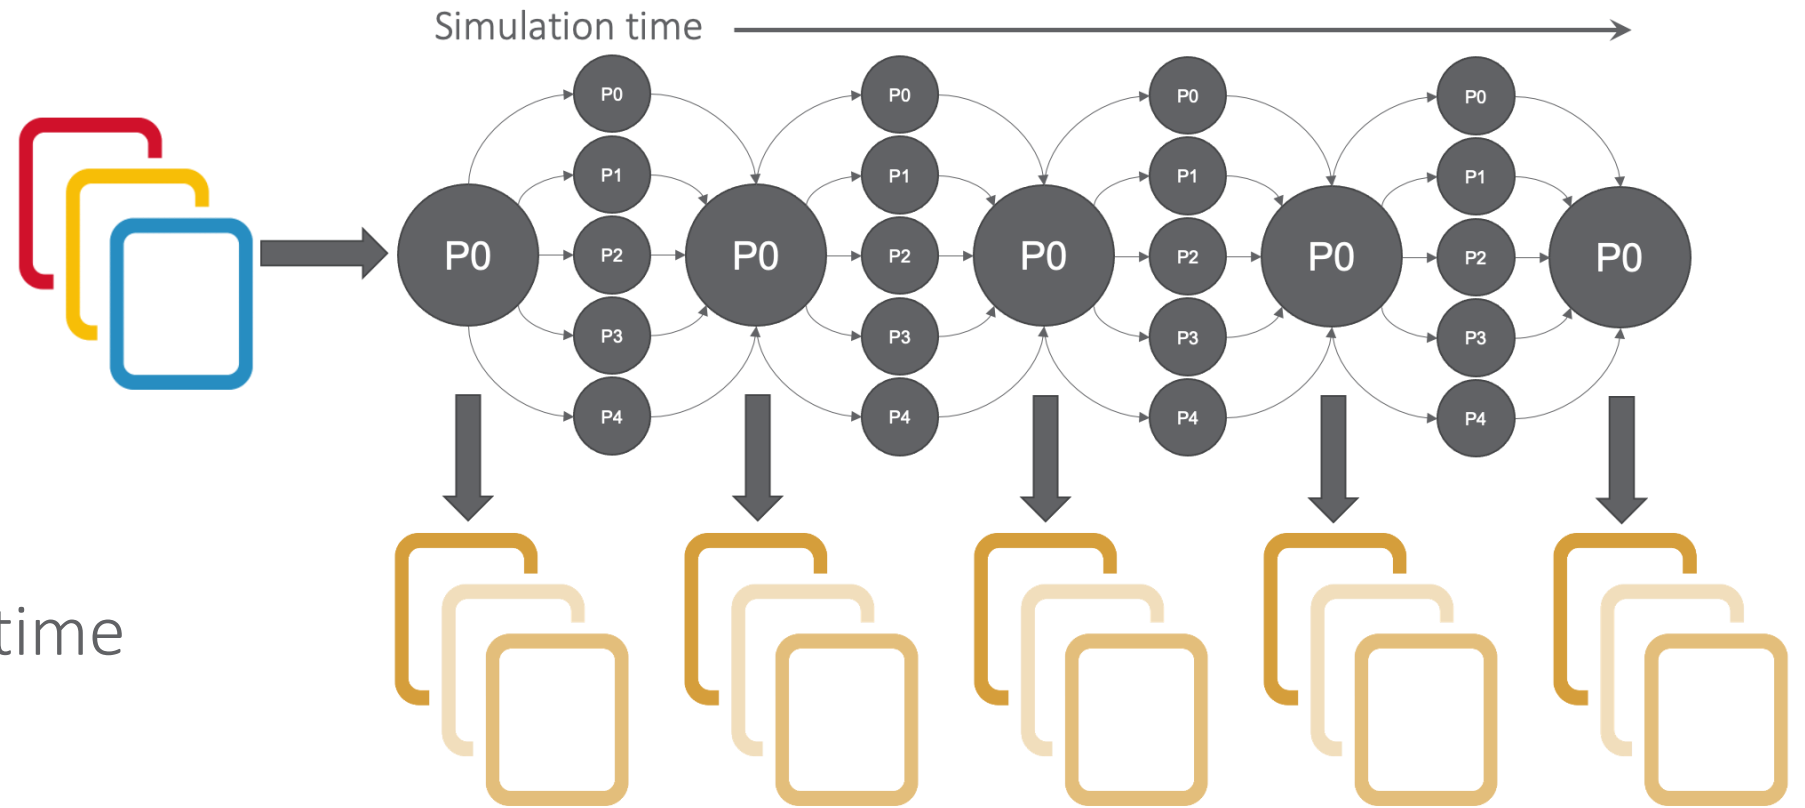

# Legacy Code Parallelization – OpenMP Implementation

## Pros

- Convenient screen output
- ASCII input and output files
- Parallel sections of code

## Cons

- Looping setup can consume time saved in parallel processing
- Limited scaling
- Worse than sequential performance possible

(Shared-Memory Computers/Nodes Only)

# Non-parallel Input/Output

# Non-parallel Input/Output

## Pros

- Convenient screen output
- ASCII input and output files
- Parallel sections of code

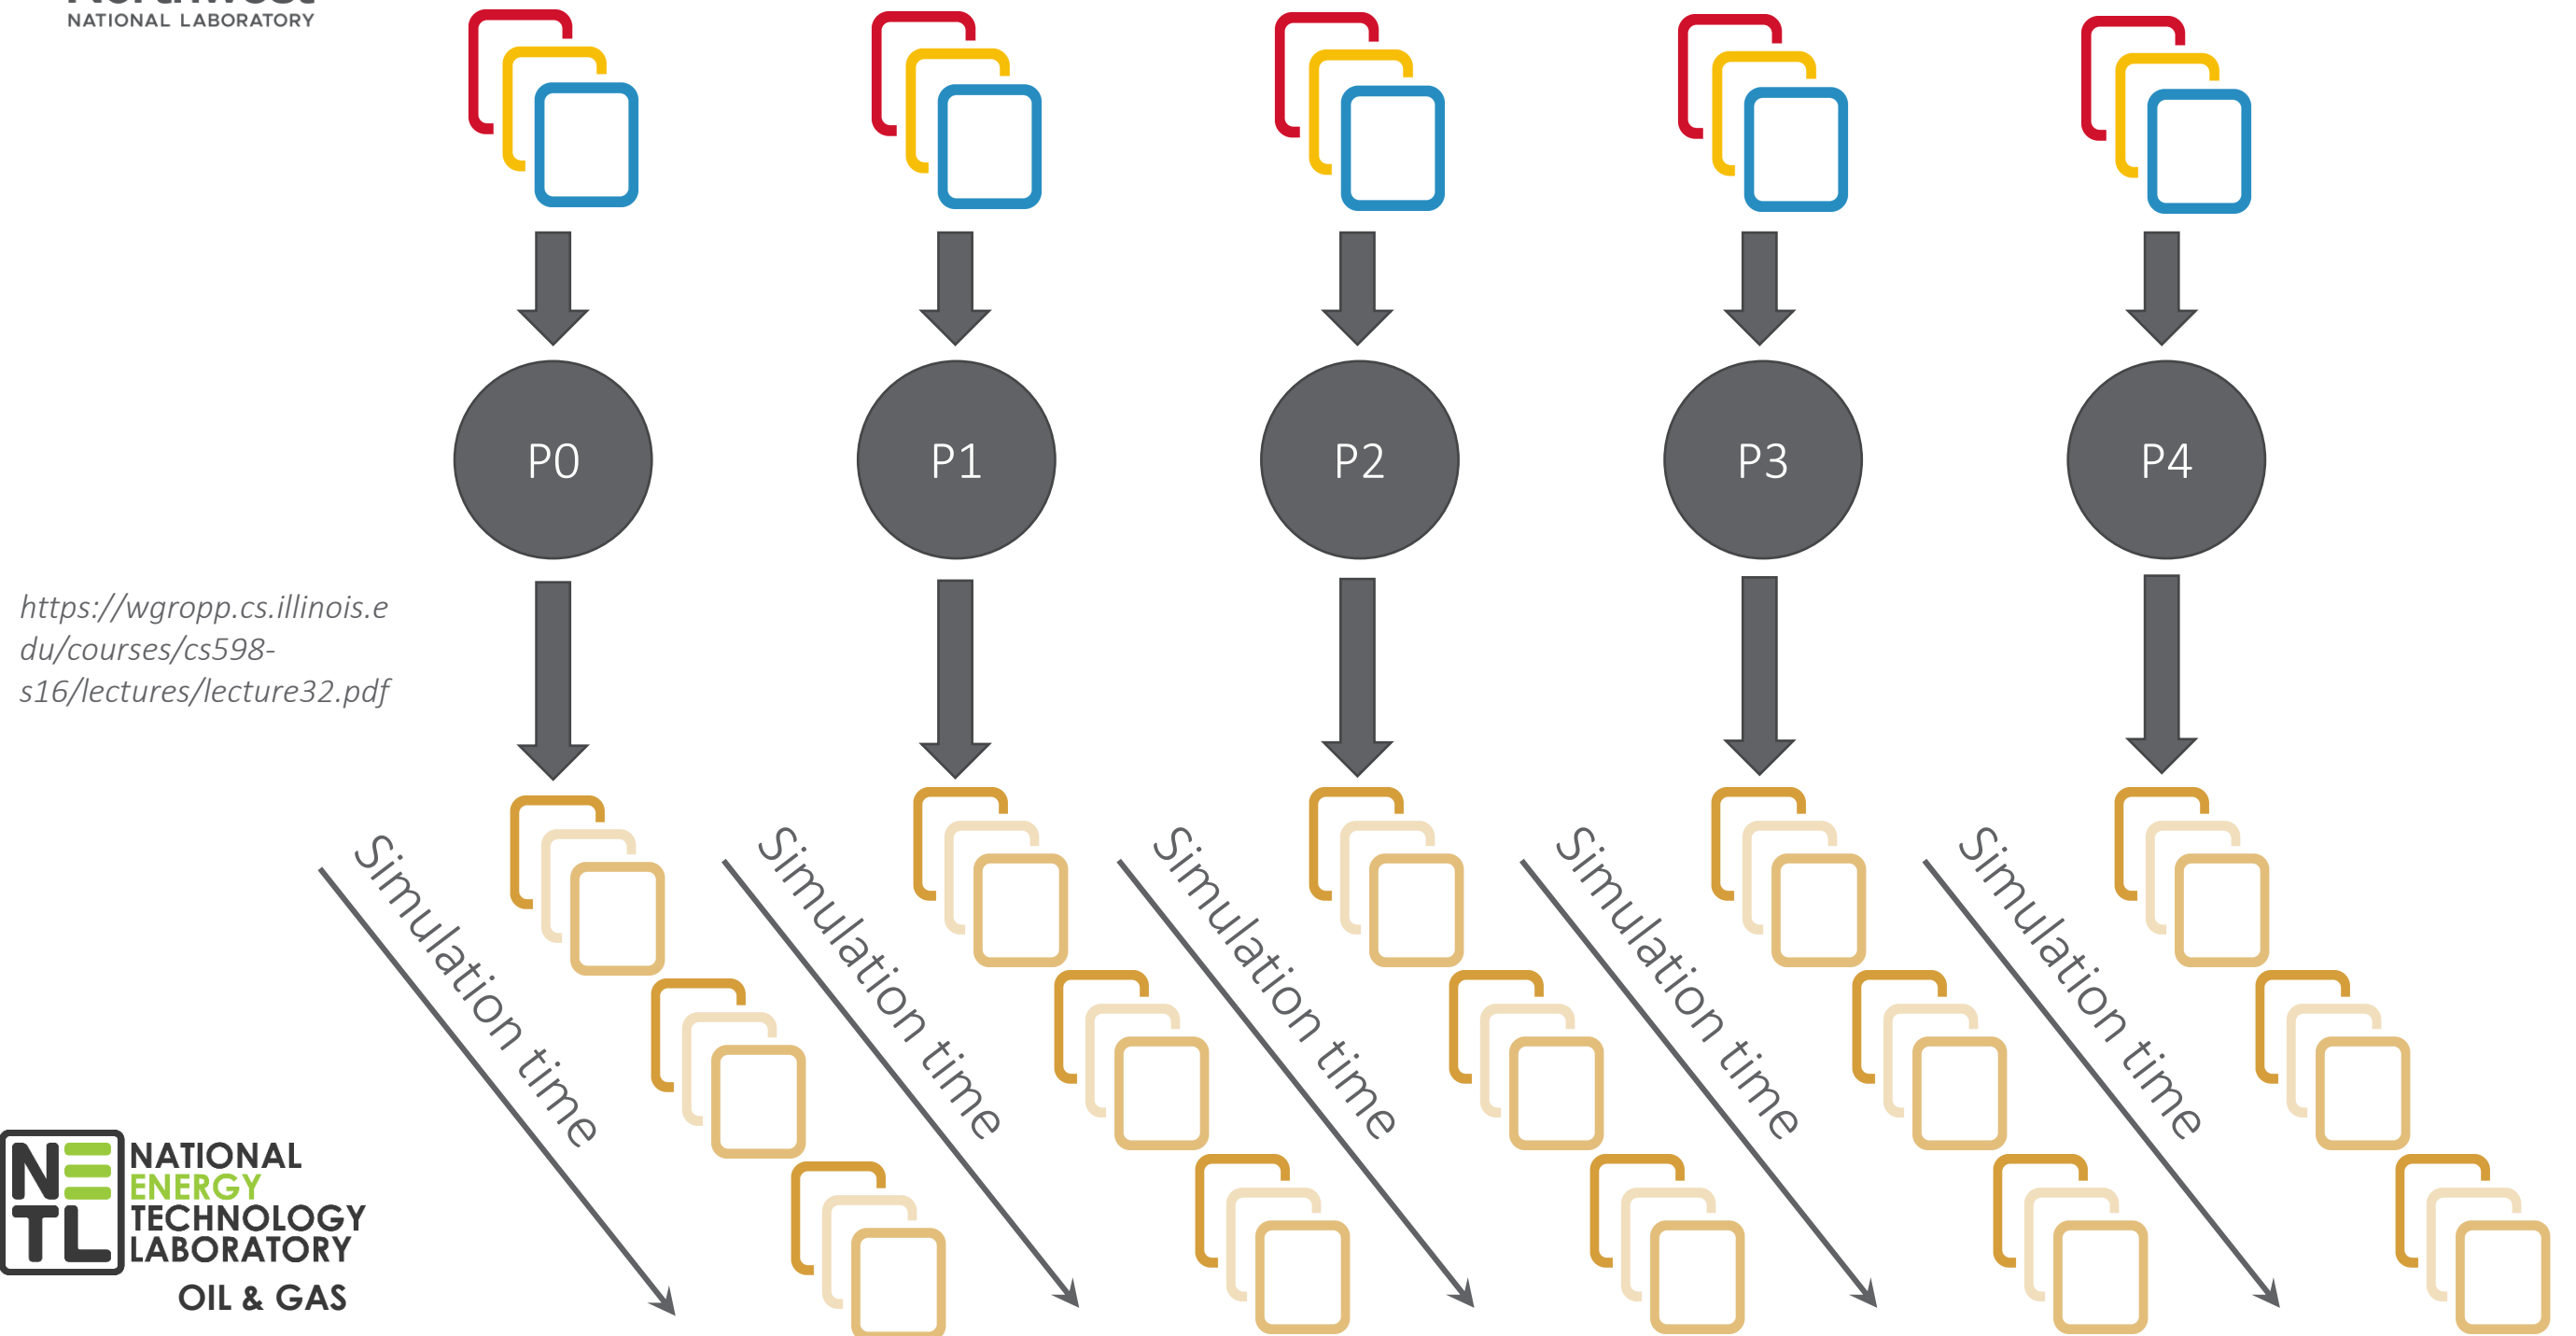

## Cons

- Distribution of inputs across processors required
- Limited scaling
- Worse than sequential performance possible

(Shared- or Distributed-Memory Computers)

# Independent Parallel Input/Output

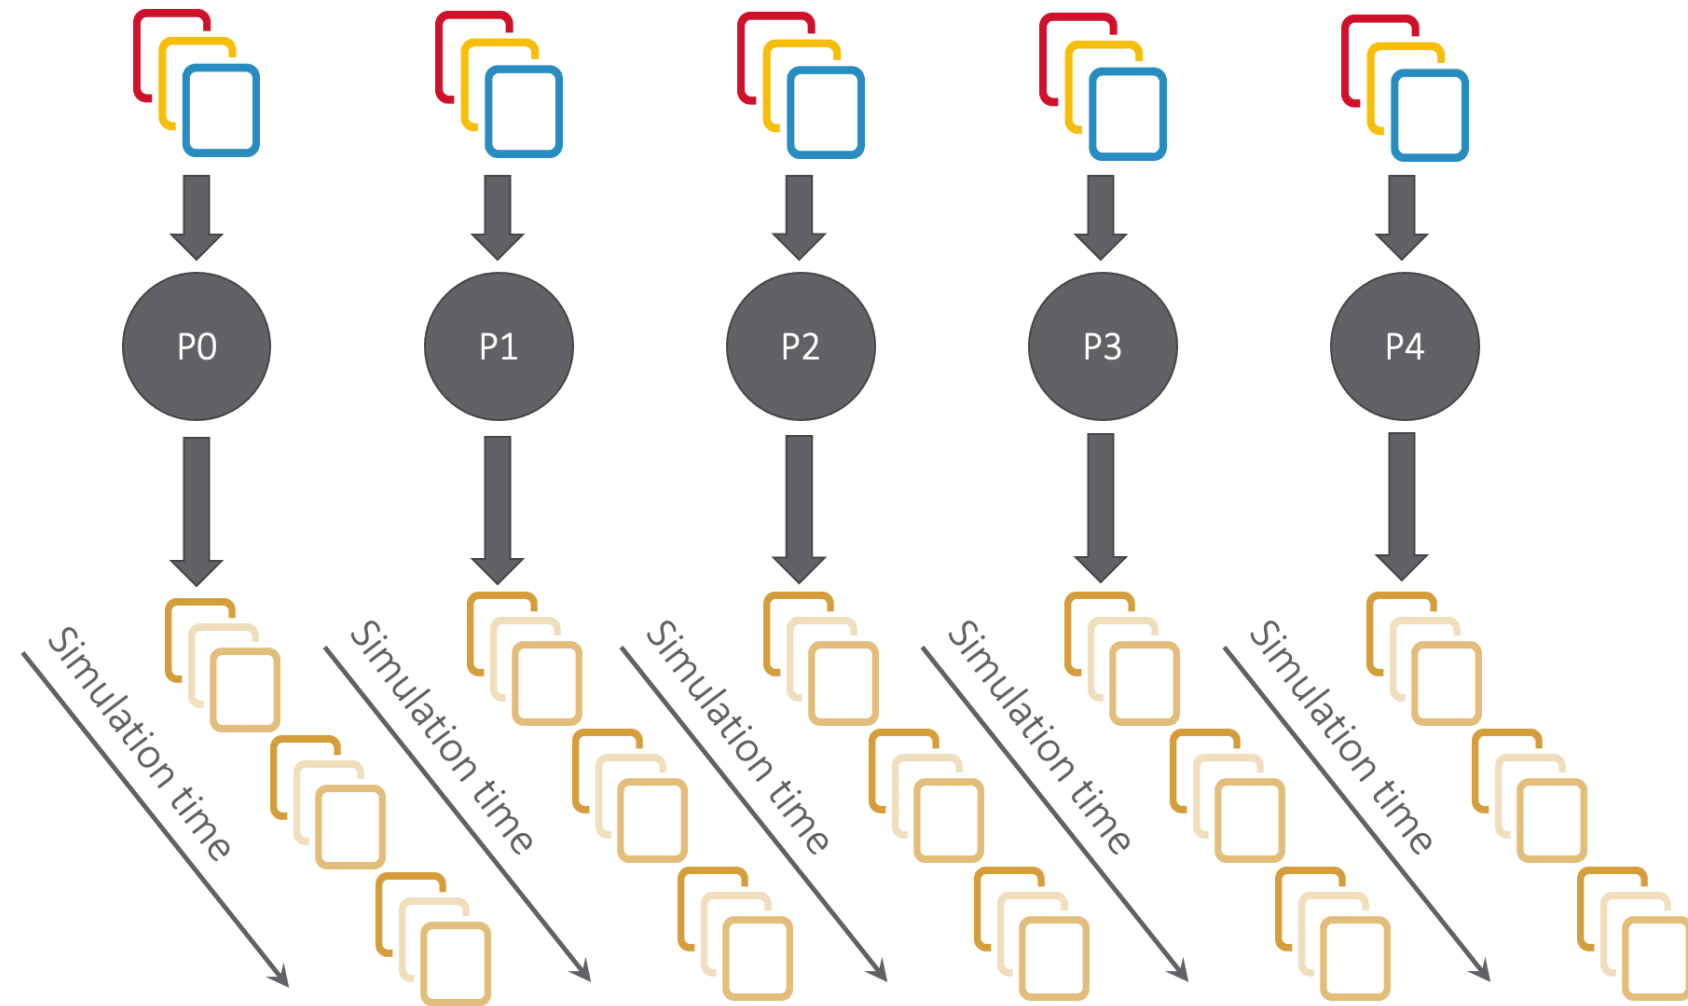

# Independent Parallel Input/Output

## Pros

- Parallelism
- Favorable strong scaling

## Cons

- Distribution of inputs across processors required
- Recombination of output files

(Shared- or Distributed-Memory Computers)

# Cooperative Parallel Input/Output

<https://wgropp.cs.illinois.edu/courses/cs598-s16/lectures/lecture32.pdf>

# Cooperative Parallel Input/Output

## Pros

- Parallelism
- Favorable strong scaling

## Cons

- Can only be expressed in MPI
  - MPI\_File\_open
  - MPI\_File\_read
  - MPI\_File\_write
  - MPI\_File\_close
- Binary input and output files

(Shared- or Distributed-Memory Computers)

# Development Concept for Legacy to MPI Conversion

Sequential STOMP-HYDT-KE applied as a preprocessor through setting initial state and phase conditions

## ASCII (text) Input Files

input (problem description)  
tertiary mixture phase envelope ( $\text{CO}_2\text{-CH}_4\text{-N}_2$ )  
tertiary mixture gas hydrate equilibria ( $\text{CO}_2\text{-CH}_4\text{-N}_2$ )

## Binary Input Files

boco.bin  
grid.bin  
solu.bin  
state.bin  
inhibitor.bin

sorc.bin  
prop.bin  
co2\_ch4\_n2\_pe.bin  
hyd\_co2\_ch4\_n2\_eq.bin

# Verification Example 2D Cylindrical Domain of the Alaska North Slope Problem

# Questions?

# Summary

## BP1-Task 1.0 Project Management and Collaborative Research

Collaborative project with KIGAM via the Joint Korea-U.S. Gas Hydrate Project, investigation of nitrogen injection for the Ulleung Basin of the Korean East Sea

## BP1-Task 2.0 IGHCCS2

Study paper published in Journal of Marine and Petroleum Geology

## BP2-Task 1.0 Project Management and Collaborative Research

Collaborative project with KIGAM via the Joint Korea-U.S. Gas Hydrate Project, investigation of air injection for the Ulleung Basin of the Korean East Sea

## BP2-Task 2.0 Simulations in Support of the Alaska North Slope Project

Completed simulations of core- and NMR-based scenarios, continued investigations of kSP models, and modeling scenarios.

## BP2-Task 3.0 Well Model Implementation in STOMP-HYDT-KE

Start pending.

## BP3-Task 1.0 Project Management and Collaborative Research

Collaborative project with KIGAM via the Joint Korea-U.S. Gas Hydrate Project, pending new contract with KIGAM

## BP3-Task 3.0 STOMP-HYDT-KE Parallelization

Currently ongoing
