

In-situ Optical Monitoring of Operating Gas Turbine Blade Coatings Under Extreme Environments

DE-FE0031282

Fossil Energy Sensor & Control Project Review Meeting

Quentin Fouliard, Post-doctoral Fellow

PI: Seetha Raghavan, Co-PI: Ranajay Ghosh

<https://aerostructures.cecs.ucf.edu/>

May 19, 2021

Key goals

- Develop and demonstrate at the laboratory scale an advanced optical suite of instrumentation technologies for enhanced monitoring of gas turbine thermal barrier coatings (TBCs)
- **One-year extension assigned for the demonstration of surface temperature measurement capability and deployment of the instrumentation on an engine rig for in-situ phosphor thermometry**

Project Tasks (Tasks 1-5: Oct 2017 – Oct 2020, + Task 6: Oct 2020 – Oct 2021)

Task 1: Project Management & Planning

Task 2: Define and manufacture sensor configuration

Task 3: Establish Sensing Properties and Characterize Coating Response for Luminescence Based Sensor

Task 4: Perform Non-Intrusive Benchmarking Measurements of Surface Temperature and Strain

Task 5: Develop and Test Laboratory Scale Sensor Instrumentation Package

Task 6: Instrumentation adaptation to engine rig + surface measurements

Overview of the presentation

- **Background, Motivations & Objectives**
 - Thermal Barrier Coatings and their benefits
- **Research effort was focused on providing solutions for the following:**
 - **Higher accuracy of temperature measurements (part A)**
 - **Phosphor Thermometry experimentation**
 - **Improving methods for coating damage monitoring (part B)**
 - **Coating damage monitoring**
- **Conclusions and perspectives**

Background, Motivations & Objectives

Thermal Barrier Coatings (TBCs)

- Thermal barrier coatings (TBCs) used in combination with air cooling to protect metal substrates from extreme temperatures in the high-pressure turbine (1300 to 1600°C)

Clarke, D (2012). *MRS Bulletin*, 37(10), 891-898

- Air film cooling: $\Delta T = -100$ to -400°C

Kotowicz, J, et al. *Archives of Thermodynamics* 37.4 (2016): 19-35

- TBC: $\Delta T = -150$ to -200°C [3,4,5,6]**

Sobhanverdi, R. and Alireza A. *Ceramics International* 41.10 (2015): 14517-14528.

Bacos, M. P., et al. *Review of ONERA Activities* (2011).

Darolia, R. *International Materials Reviews* 58.6 (2013): 315-348.

Xu, Li, et al. *Procedia Engineering* 99 (2015): 1482-1491.

- Major applications:

- Aeroengines
- Power generation engines

Review of TBC materials properties

TBC layer Typical composition	Top coat 7-8wt.%YSZ	TGO Al ₂ O ₃	Bond coat NiCrAlY / PtAl
Thermal conductivity λ at 1100°C (W/(m·K))	1-3 [1,2,4,5]	5-6 [4,6]	34 [5]
Coefficient of thermal expansion α ($\times 10^{-6}$ K ⁻¹)	11-13 [3,4,7,8]	7-10 [3,7,8,9]	13-16 [3,7,8,9]
Elastic modulus (GPa)	0-100 [13]	320-434 [3,7,8,9]	110-240 [3,7,9]
Toughness K (MPa·√m)	0.7-2.2 [7,10]	2.8-3.2 [7,11]	>20 [7]
Poisson's ratio ν	0.2 [8]	0.2-0.25 [8,9]	0.3-0.33 [8,9]
Oxygen diffusivity at 1000°C (m ² /s)	10 ⁻¹¹ [4]	10 ⁻¹⁹ -10 ⁻²¹ [4,6]	-
Crystal microstructure (phase) Stable up to	t' 1200°C [12]	α 1750°C	β, γ 1050°C

Wang, L., et al *Journal of thermal spray technology* 23.3 (2014): 431-446.

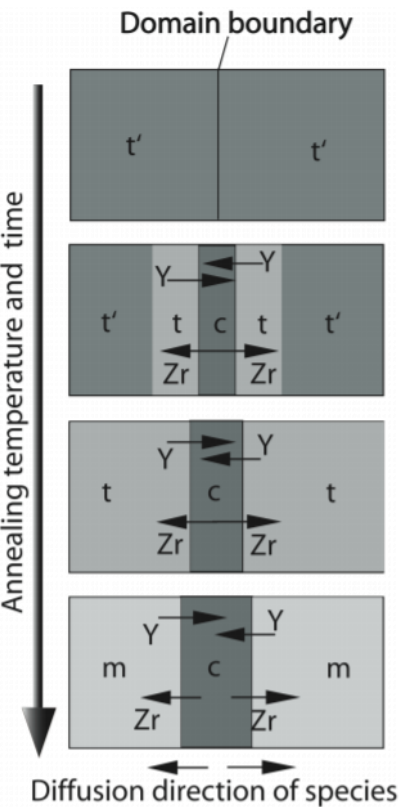

Temperature drives oxide growth in TBCs and is a key factor in coating failure

Phase stability in Thermal Barrier Coatings (TBCs)

Importance of controlling the operating temperature

- Standard top coat material: 7-8wt.% (4-4.5 mol.%) YSZ optimal for resistance to spallation and thermal stability Patnaik, P. et al, National Research Council Of Canada Ottawa, Ontario (2006)

- Y³⁺ introduces oxygen vacancies that stabilizes t'

Witz, G., et al. *Advanced Ceramic Coatings and Interfaces II: Ceramic and Engineering Science Proceedings*, Volume 28, Issue 3 (2007): 39-51.

- High temperature sintering of t'-YSZ:
 - Pore coarsening → thermal conductivity increase Guignard, A. Vol. 141. Forschungszentrum, Jülich, (2012).
 - Crack forming
- t' phase stable up to 1200°C:
- $t' \xrightarrow{1200^{\circ}\text{C}} t + c \xrightarrow[600^{\circ}\text{C}]{\Delta V = +4\%} m + c$

Accurate control of TBC operating temperature is needed to control degradation of coatings.

Witz, G., et al. *Advanced Ceramic Coatings and Interfaces II: Ceramic and Engineering Science Proceedings*, Volume 28, Issue 3 (2007): 39-51.

Significance of TBC temperature measurements

- State-of-the-art TBCs are not being used to their highest potential because of uncertainties in temperature measurements at high-temperature.
 - Safety margins as high as 200°C are used.
- Ideal Brayton cycle efficiency: $\eta = 1 - \frac{T_c}{T_t}$
 η : cycle efficiency, $\frac{T_c}{T_t}$: temperature ratio compressor exit / turbine inlet.
- 1% efficiency improvement can save \$20m in fuel over the combined-cycle plant life.
- A 130°C increase leads to a 4% increase in engine efficiency.
- Failure mechanisms are driven by temperature conditions in the depth of the TBC.

Steenbakker, R, (2009) *Journal of Engineering for Gas Turbine and Power*, 131-4 p 041301

Ruud, J, (2003). *Performance of the Third*, 50 pp 950-4.

Problem statement:

Accurate determination of thermal gradients in Thermal Barrier Coatings (TBCs) is critical for the safe and efficient operation of gas turbine engines. Failure mechanisms are thermally activated during engine operation, uncertainty in temperature measurements contribute significantly to lifetime uncertainty.

Measurement techniques for *in-situ* temperature evaluation of TBCs

	Thermocouples	Infrared Thermometry	Phosphor Thermometry
Operational temperature range (°C)	-250 to 2320	-50 to 2000	-250 to 1700
Advantages	<ul style="list-style-type: none"> - Inexpensive - Wide temperature range 	<ul style="list-style-type: none"> - Wide temperature range - Non-contact method - Fast response time 	<ul style="list-style-type: none"> - Non-contact method - High sensitivity at high temperatures - Fast response time - Usable on rotating parts - Low sensitivity to turbine environment (aging and contamination)
Drawbacks	<ul style="list-style-type: none"> - Intrusive probe - Disrupts flow patterns - Not chemically stable in all environments - Low accuracy - Unusable on rotating surfaces 	<ul style="list-style-type: none"> - Optical access required - Sensitive to stray light (flames) - Sensitive to emissivity variations 	<ul style="list-style-type: none"> - Optical access required - Signal weakening at high temperatures

Gas turbine efficiency

Components lifetime

Other critical failure mechanisms: Foreign object damage / Erosion

Importance of controlling coating health

Tanaka, Makoto, Yu-Fu Liu, and Yutaka Kagawa. *Journal of Materials Research* 24.12 (2009): 3533-3542.

Lima, Rogerio S., Bruno MH Guerreiro, and Maniya Aghasibeig. *Journal of Thermal Spray Technology* 28.1-2 (2019): 223-232.

- Unpredictability of the impact damage/erosion
 - Amount of degradation
- **Importance of improving methods for detection and quantification of delamination**

Direct damage monitoring methods

- Thermal/optical imaging techniques;
 - Infrared thermography in mid-wave or long-wave infrared, post-exposition to an intense heat source (generally a flash of light).
 - Tomography
 - Laser scattering
 - Luminescence-based mapping (in-situ or ex-situ monitoring), under excitation at specific wavelength.

Luminescence imaging provides:

- **Finer spatial resolution**
- **Richer information through spectral features**

Proposed solutions & key objectives

- **Better temperature control in gas turbine engines is needed to improve engine efficiency and reduce maintenance and operation costs (part A)**
 - Implementation of phosphor thermometry instrumentation with accuracy/precision improvement vs. current state-of-the-art
 - Determination of precise sub-surface location of phosphor thermometry measurement point
- **Intense operation of TBC systems results in coating failure that impacts engine availability (parts B and C)**
 - Development of a novel approach for delamination monitoring using luminescent coatings (compatible with phosphor thermometry coatings)
 - Verification of sensor coating properties in operational environments

Part A: Phosphor Thermometry measurements

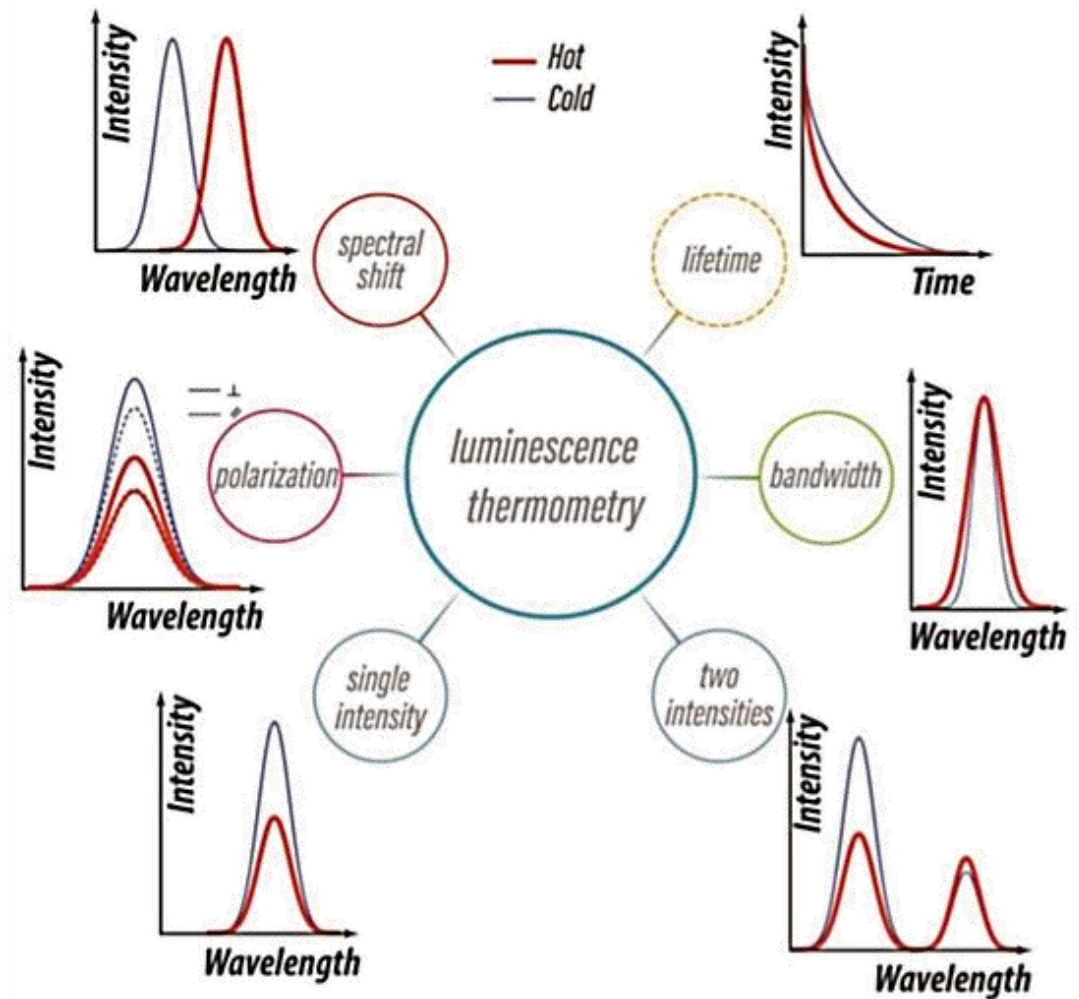

Part of tasks 2, 3, 4, 5 & 6

Phosphor Thermometry – fundamentals

- Typical dopants are rare-earth elements and transition metals.
- Electronic configuration determines the usable excitation wavelength.
- Emission wavelength is generally longer than excitation wavelength.

Instrumentation developed for synchronized luminescence decay collection

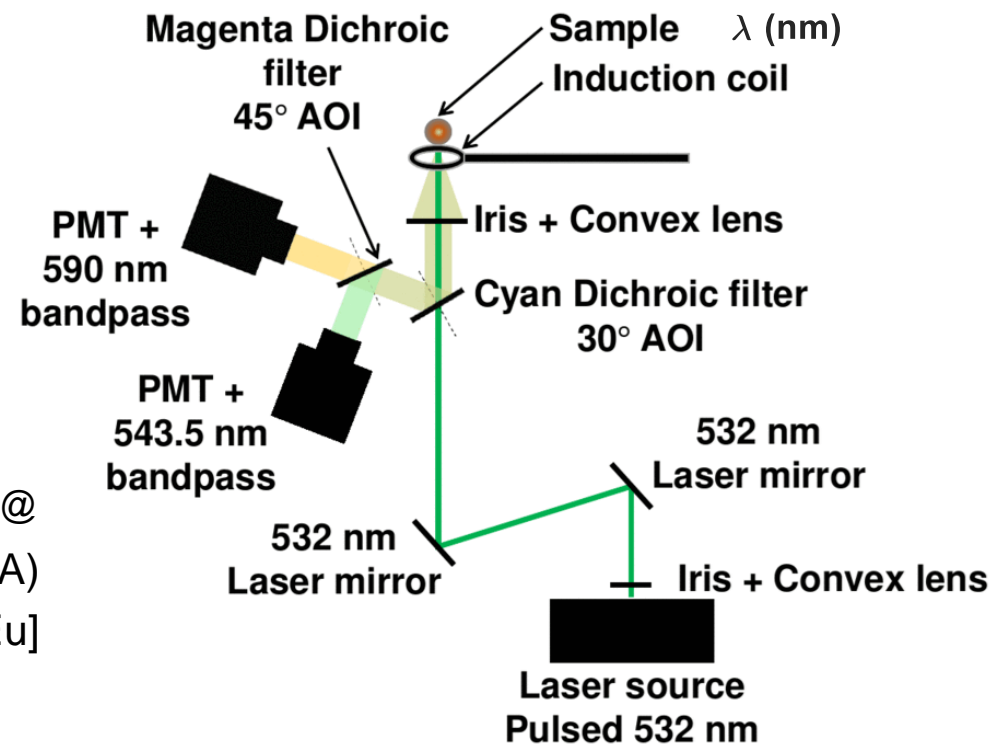

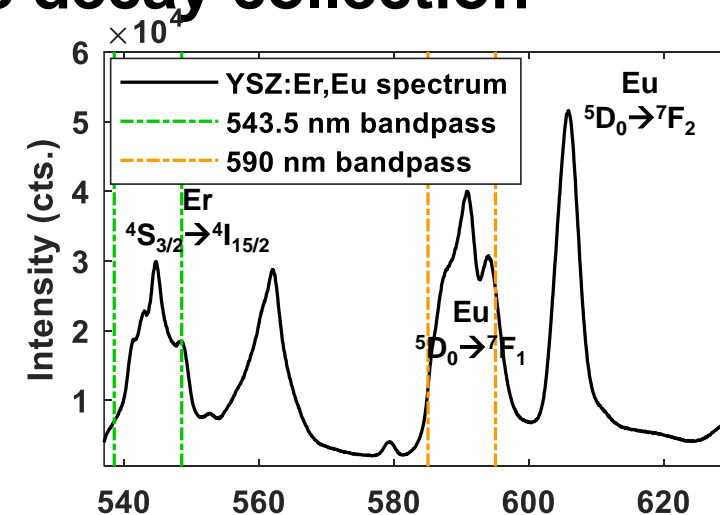

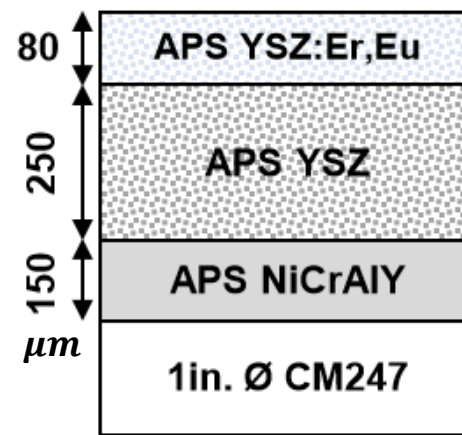

Fouliard et al., *Measurement Science & Technology*, 2020

Parameters:

Nd:YAG 532 nm
0.5 mJ pulse
10 Hz
20 ns pulse duration

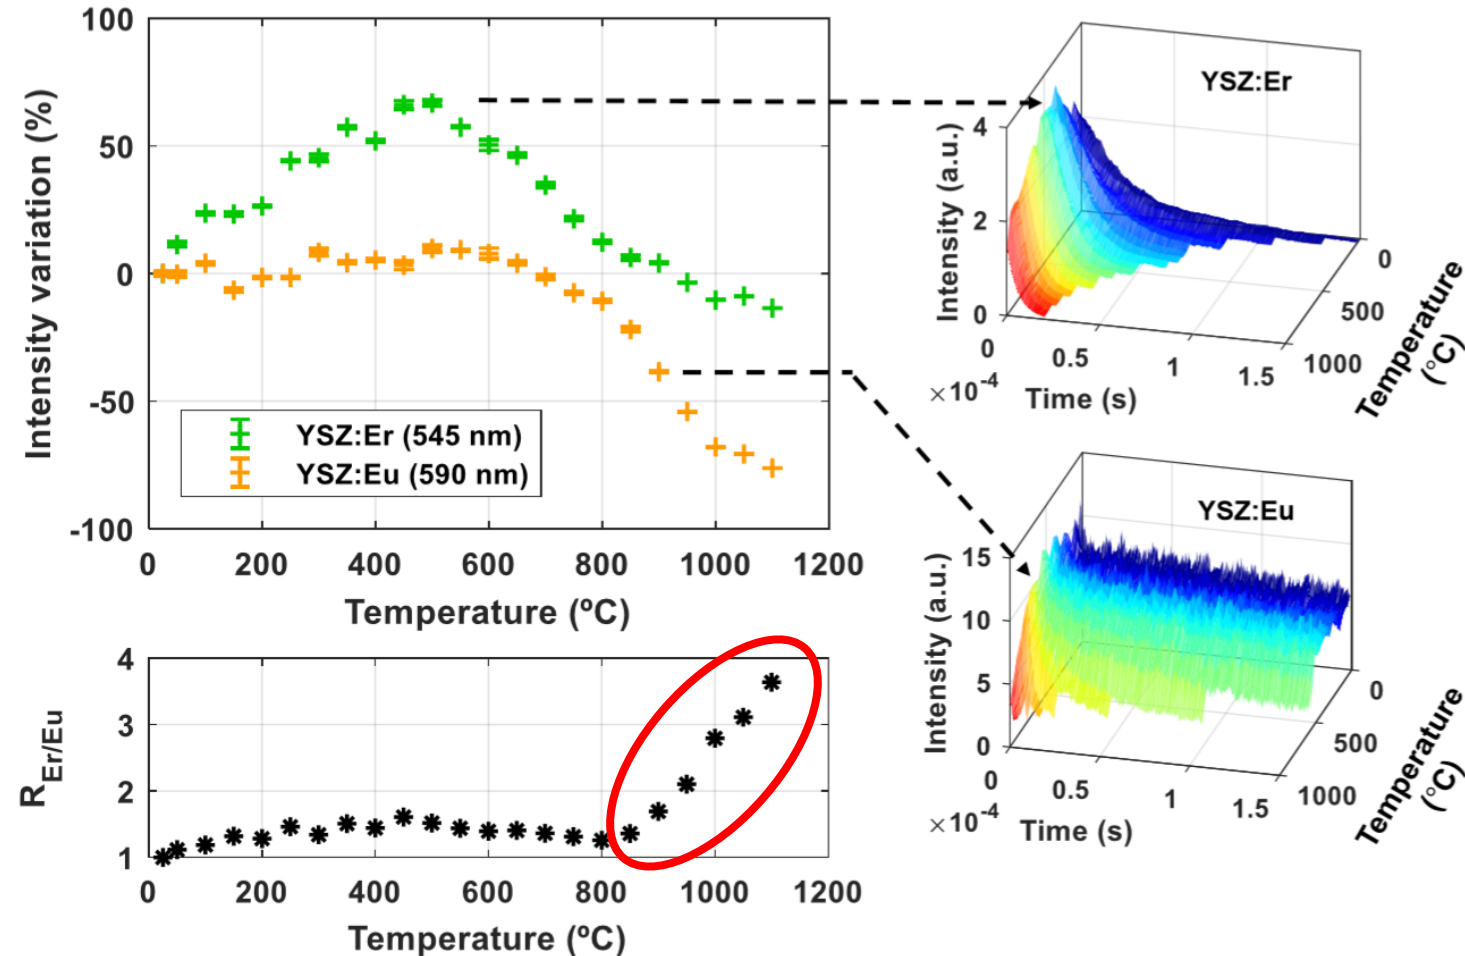

Sample:

Air Plasma Spray (UCF team @ FIT, Melbourne, FL, USA)
YSZ:Er,Eu [1.5% Er, 3% Eu]
(Phosphor Technology, UK)
Annealed 2h @ 800°C

Extension of temperature range vs. state-of-the-art

- Luminescence of Europium is quenched rapidly past 500°C, for high sensitivity measurements up to 850°C where reaching detector response limit.
- Temperature range extended by collecting the ratio of the normalized intensity variation Erbium/Europium.

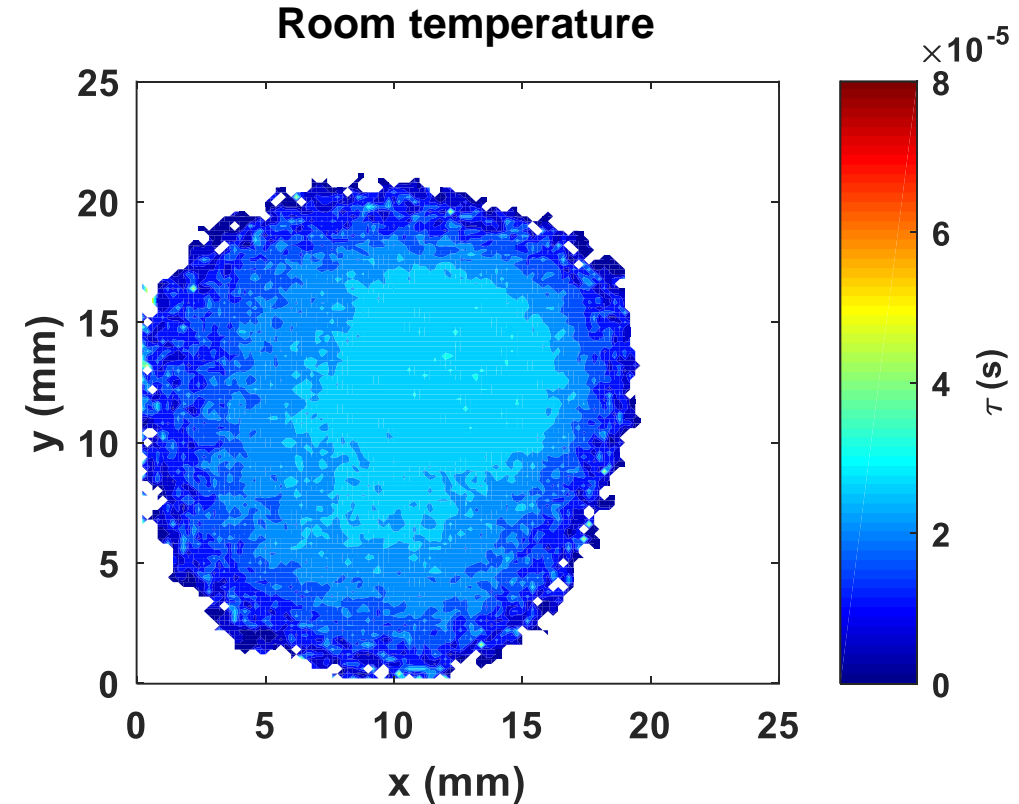

Fouliard et al., *Measurement Science & Technology*, 2020

High-speed camera testing setup for coating surface temperature measurements

A first step towards the upgrade/conversion of the setup for engine rig testing was to enable surface measurement:

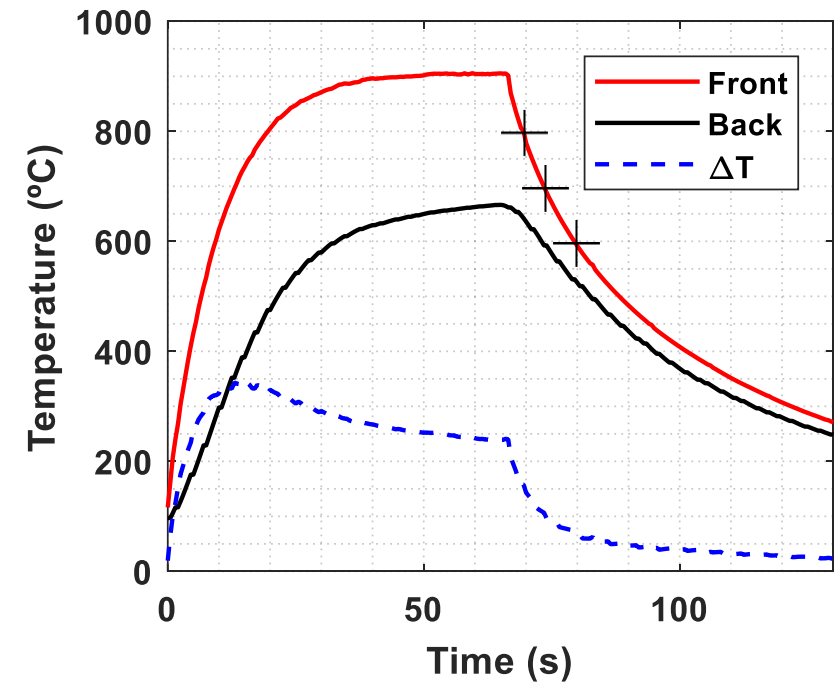

→ Completed successfully with:

- High-speed camera (Photron Nova S12):
 - 250k frames/s
 - 128x128 pixel resolution
 - ISO 64,000
- Infrared camera (TIM450) – reference meas.:
 - Longwave (7.5-13 microns)
 - Emissivity set to 0.93

- Lifetime decay needs to be calibrated for each pixel for high temperature measurements and quantifying temperature gradients on coating surface

High-speed camera testing – heating and measurement methods:

- Initial temperature measurements achieved during cooling down phase

High-speed camera testing – initial measurements:

600°C

700°C

800°C

- Initial temperature measurements tend to show temperature gradient from left (hotter, faster decay) to right (colder, slower decay)
- Current work involves pixel-decay calibration

Part B: Coating damage monitoring

Part of tasks 3 & 4

Modeling delamination

Q. Fouliard, R. Ghosh, S. Raghavan *Surface and Coatings Technology* (2020): 126153.

Diffuse external reflectivity

$$\rho_0(n) = \frac{1}{2} + \frac{(3n + 1) \cdot (n - 1)}{6 \cdot (n + 1)^2} + \frac{n^2 \cdot (n^2 - 1)^2}{(n^2 + 1)^3} \cdot \ln\left(\frac{n - 1}{n + 1}\right) - \frac{2n^3 \cdot (n^2 + 2n - 1)}{(n^2 + 1) \cdot (n^4 - 1)} + \frac{8n^4 \cdot (n^4 + 1)}{(n^2 + 1) \cdot (n^4 - 1)^2} \cdot \ln(n)$$

Max diffuse internal reflectivity

$$\rho_{i,max}(n) = \left(1 - \frac{1}{n^2}\right) + \frac{\rho_0(n)}{n^2}$$

Frustrated angle-averaged reflectivity

$$\overline{R}_f(d) = \frac{\int_0^{2\pi} \int_{\theta_c}^{\frac{\pi}{2}} \frac{\alpha \cdot \sinh^2(\beta \cdot d)}{1 + \alpha \cdot \sinh^2(\beta \cdot d)} \cos \theta \cdot \sin \theta d\theta d\varphi}{\int_0^{2\pi} \int_{\theta_c}^{\frac{\pi}{2}} \cos \theta \cdot \sin \theta d\theta d\varphi}$$

$$\alpha_{\perp} = \frac{(n^2 - 1)^2}{4n^2 \cdot \cos^2 \theta \cdot (n^2 \sin^2 \theta - 1)}$$

$$\alpha_{\parallel} = \alpha_{\perp} \cdot (\sin^2 \theta \cdot (n^2 + 1) - 1) \qquad \overline{R}_{f,unp} = \frac{\overline{R}_{f,\perp} + \overline{R}_{f,\parallel}}{2}$$

$$\beta = \frac{2\pi}{\lambda_0} \sqrt{n^2 \cdot \sin^2 \theta - 1}$$

$$\rho_i(d) = \overline{R}_{f,unp}(d) \cdot \left(1 - \frac{1}{n^2}\right) + \frac{\rho_0(n)}{n^2}$$

Layer	n	$\rho_{i,max}$
Air	1	84%
Top coat	2.17	39%
TGO	1.76	
Top coat - Bond coat		4%

Photoluminescence results

2 sensor EB-PVD TBC configurations including an YSZ:Er layer (provided by NASA Glenn / PSU) were characterized by luminescence mapping (tracking of Er-line at 562 nm):

Sensing layer at the top

Conclusions & Perspectives

Conclusions

- Precise determination of temperatures in TBCs can result in large benefits in terms of fuel savings, reduction of emission, as well as better monitoring of TBC lifetime
- Enabled the extension of the range of measurable temperatures using phosphor thermometry with higher sensitivity by capturing simultaneously luminescence decays and intensities using a co-doped YSZ:Er,Eu sensor TBC.
- Developed surface temperature measurement capabilities using a high-speed camera setup.
- Currently extending the instrument to engine rig setup for in-situ temperature measurements.
- Enabled accurate determination of delamination in coatings through a novel modeling approach, validated with experiments.

Future work

Ongoing work with collaborators that was initiated with this project:

- Additional synchrotron experiments for rare-earth doped TBC strain measurements (collaboration: GE Research, Argonne National Lab).
- Model adaptation and experimentation using high-emissivity paints for improved temperature measurements on painted TBCs (collaborator: GE Aviation).

Task 6:

- Continuation of high-speed camera testing and analysis work.
- Adaptation of the instrumentation to operate on an engine rig (Tasks 1-5 successfully demonstrated lab-scale functionality as planned – the existing built-up will now be adapted to rapidly increase its technology readiness level), starting with the exhaust section of UCF (Dr. Ahmed) ramjet engine and going towards more challenging engine sections like high-pressure turbines or RDE walls.

ANNEX

Phosphor Thermometry – intensity ratio method

- Thermal quenching and growing thermal radiation limits luminescence detection at high temperature.
- Thermal filling of the excited states

Fig. 2. Typical emission spectra of $\text{GdVO}_4:6 \text{ mol.\%Eu}^{3+}$ sample over a temperature range of 298–823 K.

Nikolić, Marko G., Dragana J. Jovanović, and Miroslav D. Dramićanin. "Temperature dependence of emission and lifetime in Eu^{3+} - and Dy^{3+} -doped GdVO_4 ." *Applied optics* 52.8 (2013): 1716-1724.

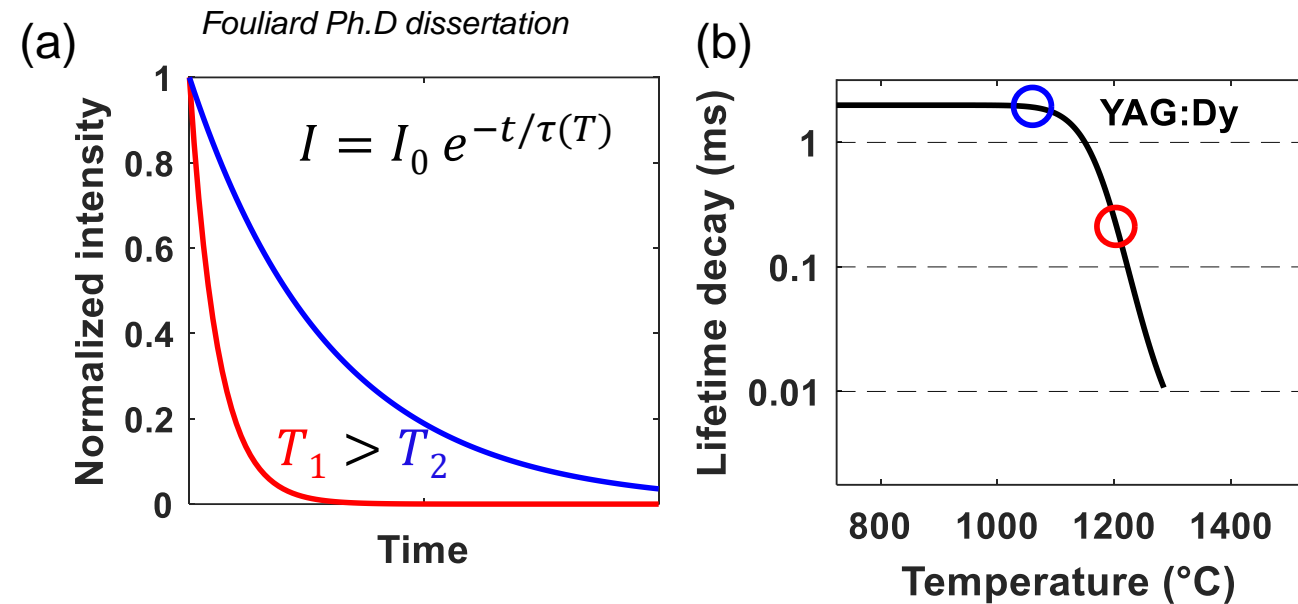

Background - Phosphor Thermometry – luminescence decay method

- The time dependent intensity is measured following the excitation pulse to determine the temperature dependent decay time $\tau(T)$.

Luminescence lifetime decay:

$$\tau = \frac{1}{W_r + W_{nr}}$$

τ : lifetime decay,
 $W_{r/nr}$: radiative and non-radiative deexcitation rates.

Schematic of (a) Normalized intensity vs. time for temperature T_1 and T_2 , (b) correlating decay time with temperature

- Thermal quenching accelerates decay due to higher probability of vibrational deexcitation. Knappe, C. *PhD dissertation Lund University* (2013)

Absolute sensitivity:

$$S_a = \left| \frac{dQ}{dT} \right|$$

Q: sensor variable (τ or R),
 T: temperature

- Higher sensitivity of the decay method in comparison with the intensity ratio method but often limited to a reduced temperature range. Heeg, et al. *AIP Conference Proceedings*, Vol. 1552, (2013)

Project extension (task 6): Instrument adaptation to engine rig

- Instrument optimization for Er and Eu luminescence sensing
- Improved filtering of gas radiation
- Multi-mode fiber collimator with high-damage threshold ($0.5 \text{ mJ/pulse} \approx 20 \text{ ns}$)

Project extension: Instrument adaptation to engine rig (initial test)

UCF Ramjet exhaust wall in-situ measurement

Measured
location

- Room temperature measurements
- The thermal aging (100h at 800°C) resulted in TGO growth and compressive in-plane strain
- The strain magnitude remains comparable overall between reference (R) and sensor (S) coatings
- We look here at the deviatoric strain measured for peaks (112) and (110) in addition of main analysis peak (101)

Deviatoric strain vs. coating depth using $t'-(101)$

- Strains were measured with a depth resolution of 15 μm and 3 scans were performed for each coating and at each temperature hold to solidify results and to be able to statistically compare strain results
- e₂₂ (in blue on the plots) is the in-plane (along the coating surface) strain, which gets compressive closer to the bond coat after thermal aging and this strain shows particularly at room temperature – generating coating fatigue under cyclic operation
- Strains are globally similar between R0 and S0 and R1 and S1, with low strain at top coat - bond coat interface, which is promising for the safe use of sensor coatings as they seem to possess comparable response under representative environments

Calculation of in-plane stress for coating comparison

$$\sigma_{22} = \frac{1}{\frac{1}{2}s_2} \left[\varepsilon_{22} - \frac{s_1}{\frac{1}{2}s_2 + 3s_1} (\varepsilon_{11} + \varepsilon_{22} + \varepsilon_{33}) \right]$$

R1 <i>reference</i>	S1 <i>sensor coating</i>
100h at 800°C	100h at 800°C

- σ_{22} calculated for coatings in operational conditions (here measured either at room temperature or at 1000°C) remains similar in sensor coatings and in state-of-the-art (reference) coatings
