Project Overview

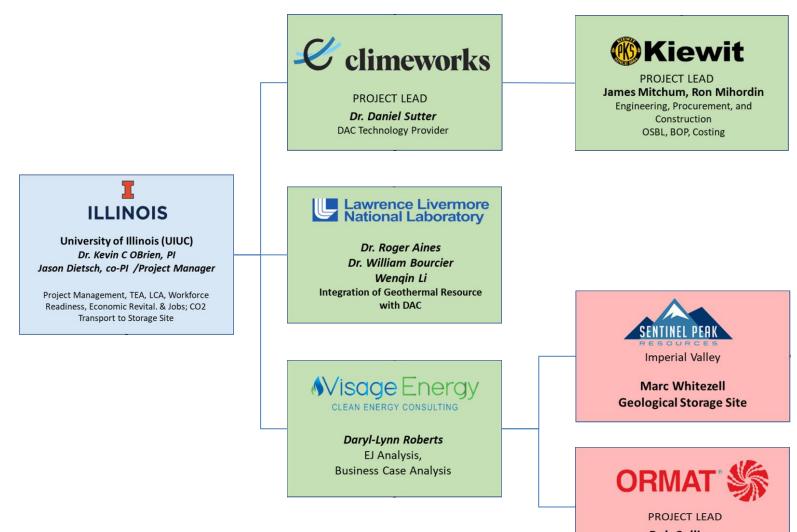

Funding: \$3,142,812 DOE: \$2,498,908 20% Cost Share: \$643,904 Work Period: 1 Sept 2022 – 29 Feb 2024

Project objectives

The overall objective of this project is to complete a front-end engineering and design (FEED) study of an advanced Direct Air Capture (DAC) system that can remove and sequestering a minimum of 5,000 tonne/yr of CO_2 . The selected DAC system will be technology from Climeworks AG (Climeworks) that consists of an adsorption-desorption process to remove CO_2 from ambient air by using a selective filter. The geothermal host site is operated by Ormat Technologies Inc. (Ormat). The DAC system will capture CO_2 using thermal energy from the host geothermal resource. The captured CO_2 will meet the requirements of transport and geological storage, and the geological storage facility is 557 kilometres from the capture site.

Project Team Management Structure

Bob Sullivan Geothermal Resource Operator

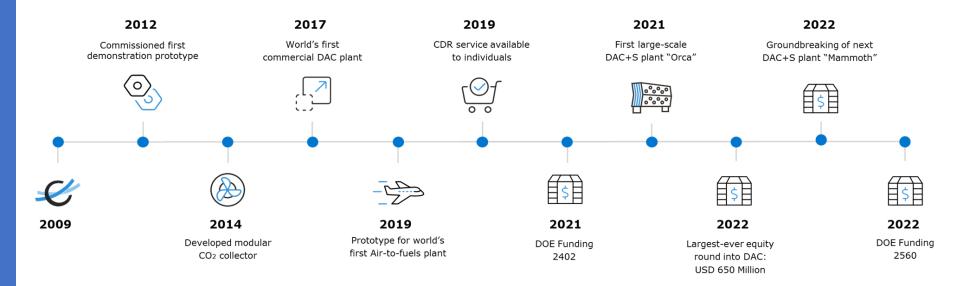

Background on capture technology

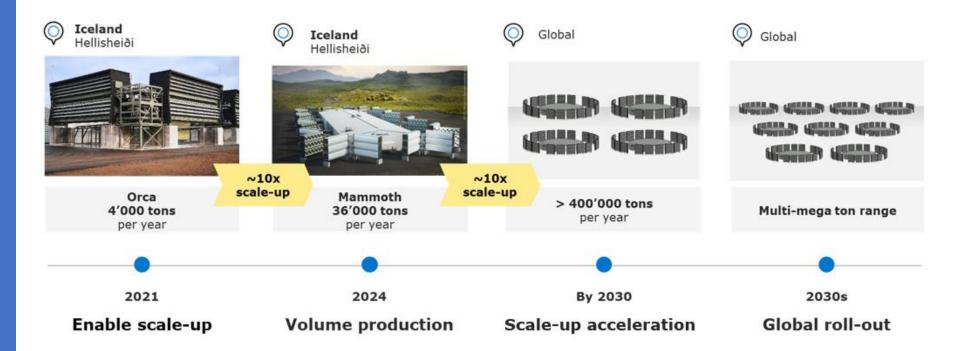

Technology Development Timeline

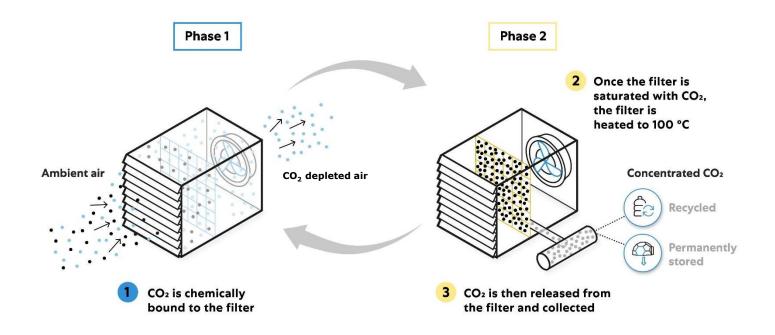

Climeworks history & milestones

Technology Development Timeline

How Climeworks technology works

- 1. Air is drawn into the collector with a fan. Carbon dioxide is captured on the surface of a highly selective filter material that sits inside the collectors.
- 2. After the filter material is full with carbon dioxide, the collector is closed and we increase the temperature to between 80 and 100 °C this releases the carbon dioxide.

Demonstrated Advantages of Technology

Mature plant design, experience in construction & operations	 Experience operating full-system prototypes as well as up to 4,000 tCO2/y units. Experience in site preparation, construction, process engineering & selection of industrial components.
Modular design	 The modular design of the DAC plants enables Climeworks to scale rapidly.
Process & sorbent technology	 Learnings from numerous laboratory test stands, mid- and full-scale prototypes as well as installations in Switzerland, Italy, Germany, and Iceland. The DAC collectors' modular nature and the flexibility of the integrated contactor structures ensure that future developments in sorbent technology can be easily integrated into existing hardware.

Host site studied for the project

Ormat Technologies, Inc.

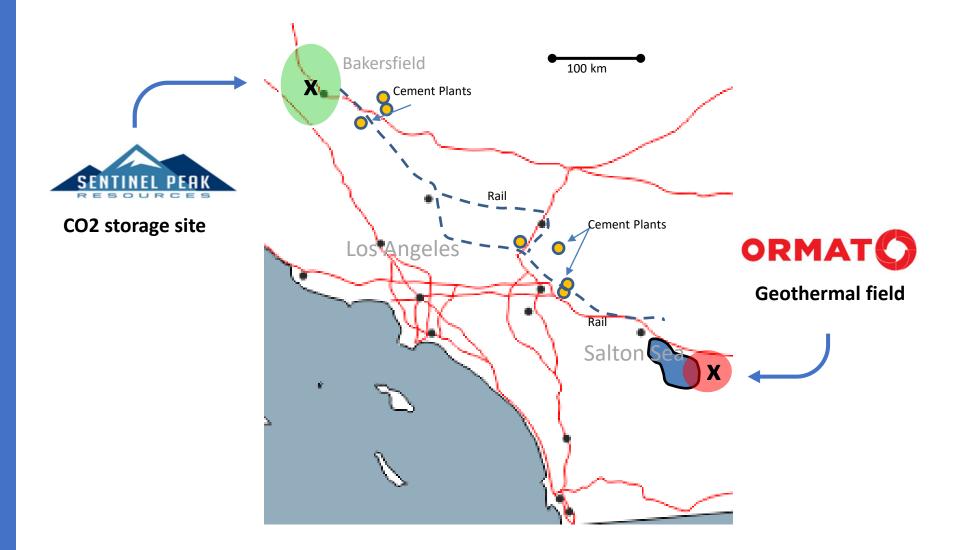

North Brawley Power Plant 27MW Geothermal Binary plant (ORC)

Sentinel Peak Resources

Saline aquifer San Joaquin Basin near Buttonwillow, CA

Location of Capture and Storage

Risk & Mitigation Strategy

	Risk	Rating : L,	M,H	
Perceived Risk	Probability Impact Overall		Overall	Mitigation and Response Strategy
Financial				
Cost share for project not obtained or insufficient	L	Н	L	Cost share commitment letters obtained.All entities providing cost share are financially sound.
Results from business cases indicate that DAC is not immediately financially attractive in the USA	М	н	М	•Business case analysis will also explore future projections and highlighted actions required to make this approach attractive in the USA.
Cost/Schedule				
Project costs and/or schedule overruns	L	Н	L	•Team has previous experience conducting DOE projects on budget and on time.
Tasks require significantly more time than expected	L	н	М	 Preliminary results from Climeworks provide good basis and understanding. Prior scale-up projects by Climeworks provide a good basis of understanding.
Technical / Scope				
Delays in selection of energy supply	L	н	М	 Previous collaboration with partner. Active dialogue with stakeholders and energy provider. Weekly progress monitoring.
Availability of energy supply at host site	L	Н	М	•Previous collaboration with partner.
Delayed supply of equipment offers for estimate	L	М	М	 Procurement review started in a timely manner allowing for some delays in response time without affecting critical part of project. Active dialogue with key suppliers to ensure that timeline is kept.
External Factor				
Issues related to COVID-19 delay execution	М	Н	М	 Team has worked virtually for months. Communication process currently in place that uses remote work tools, e.g. Microsoft Teams.
Perturbations in the energy market create financial hardships for host sites, thus reducing their interest / ability to participate	М	М	М	•Host sites view DAC as a strategically important technology for their future business plans.

Risk & Mitigation Strategy continued

	Risk Rating : L,M,H							
Perceived Risk	Probability Impact Overall		Overall	Mitigation and Response Strategy				
Management, Planning, and Oversight								
Unrealistic planning base/assumptions in project schedule may result in delays of project implementation	L	М	М	 Clear and carefully planned timeline created in collaboration with designers and engineers. Scenario-based planning, using conservative assumptions and adequate contingency time for activities on the critical path of the project. Bottom-up planning of individual activities. 				
Deficient project management may result in in inefficiencies and delays	L	М	М	 Integrated, holistic project management set up. Adequate allocation of experienced/qualified personnel to project management. Detailed milestone planning. Structured meeting, monitoring, and reporting structure to ensure real-time transparency. Defined decision-making structures and processes. 				
Availability of key personnel for project	L	М	L	•Commitment received from partner organizations.				
Unable to meet USA equipment sourcing requirements	L	М	L	Tasks included in the SOPO to achieve this requirement.Key personnel dedicated to achieving this goal.				
Unable to achieve USA labor sourcing requirements	L	М	L	•Actions already taken to achieve requirement.				
EH&S								
Handling large volumes of sorbents creates new issues from an EH&S perspective	М	М	М	•Existing projects outside the US required managing larger volumes of sorbents and addressing regeneration.
