# Project Overview

## Task 27.0: Predicting Pollutant Generation in the Subsurface to Inform Produced Wastewater Remediation and Reuse

2021  
\$315k

2022  
\$450k

2023  
\$450k

Total Project Value (2021–2023)  
\$1,215k

### Problem

Shale well production generates large volumes of wastewater with **unpredicted types and concentrations of pollutants** making treatment expensive and difficult

### Research Question

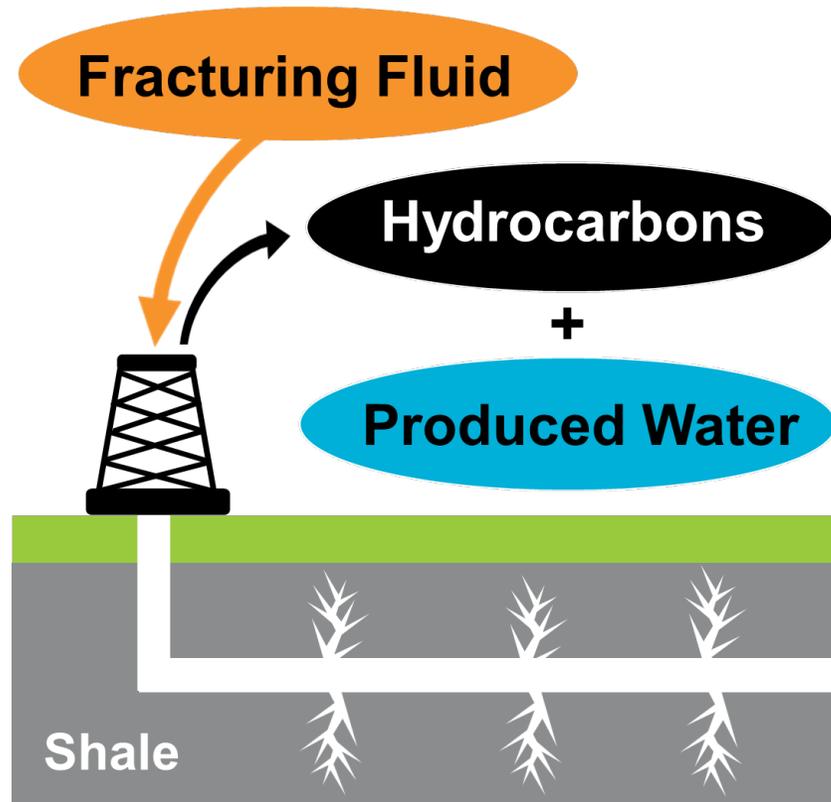

**How, when, and where** do reactions between **existing reservoir components** (i.e., minerals, clays, and organics) and **injected fracturing fluid additives** generate pollutants in produced wastewater?

### End Products

- Report on **where** pollutant generation is likely to occur, which will inform **how** pollutants can be prevented or removed
- Develop a model to predict **when** during the production curve pollutant generation is expected

# Oil & Gas Wastewater

## Shale Oil Production Generates Large Volumes of Wastewater

**Volume of water:** estimated up to 14,000,000 L per well

**Ratio of Water/Oil:** between 3 and 20

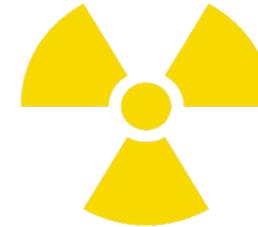

**Hazards:** Vary by location and production time

**High Salinity**

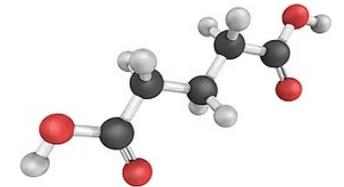

Up to 10 times  
saltier than ocean  
water

**Radioactive**

Contains Radium-226  
and other  
radionuclides

**Organic Chemicals**

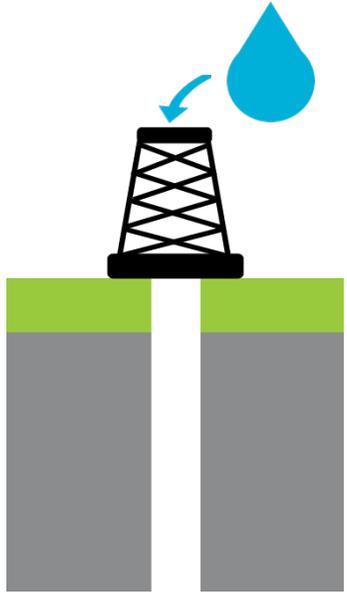

Unknown types and  
concentrations

Kondash, A. J.; Albright, E.; Vengosh, A., Quantity of flowback and produced waters from unconventional oil and gas exploration. *Science of The Total Environment* **2017**, 574, 314-321. Sanchez-Rosario, R.; Hildenbrand, Z. L., Produced Water Treatment and Valorization: A Techno-Economical Review. *Energies*, **2022**, 15, 4619.

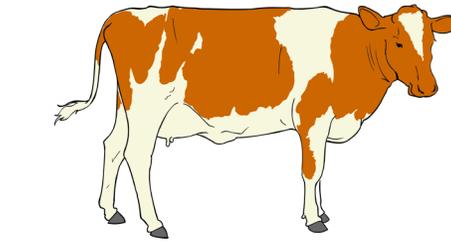

# Enabling Beneficial Reuse of Produced Water

## Better Solutions are Needed for Managing Produced Water

**Current Management:**  
Disposal Wells

**Avenues  
of Reuse**

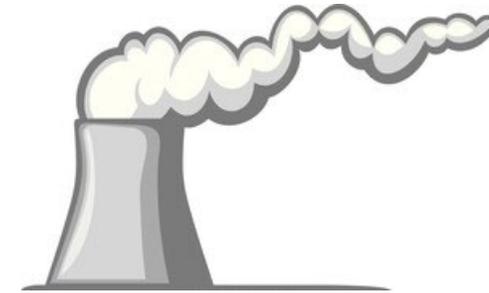

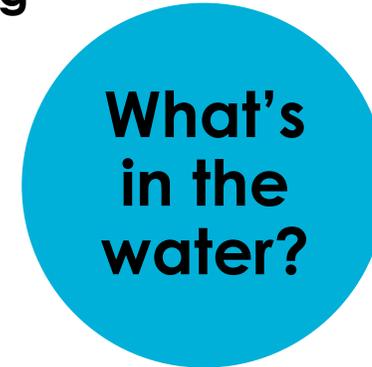

**Livestock Watering**

**Municipal Use**

**Agriculture**

**Industrial Cooling**

**Stream Augmentation**

- Causing induced seismicity
- Water strain in arid regions

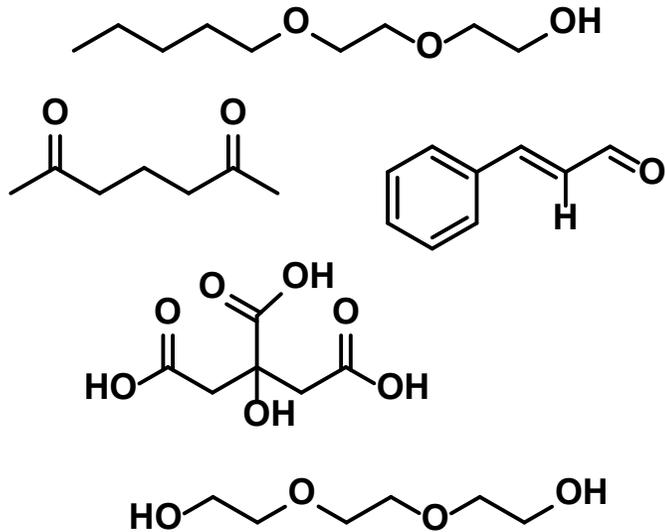

Danforth, C.; McPartland, J.; Blotevogel, J.; Coleman, N.; Devlin, D.; Olsgard, M.; Parkerton, T.; Saunders, N., Alternative Management of Oil and Gas Produced Water Requires More Research on Its Hazards and Risks. *Integrated Environmental Assessment and Management* **2019**, 15, 677-682.

# Organic Chemicals in Produced Water

Unpredicted Types and Concentrations of Organic Contaminants Make Treatment Expensive and Difficult

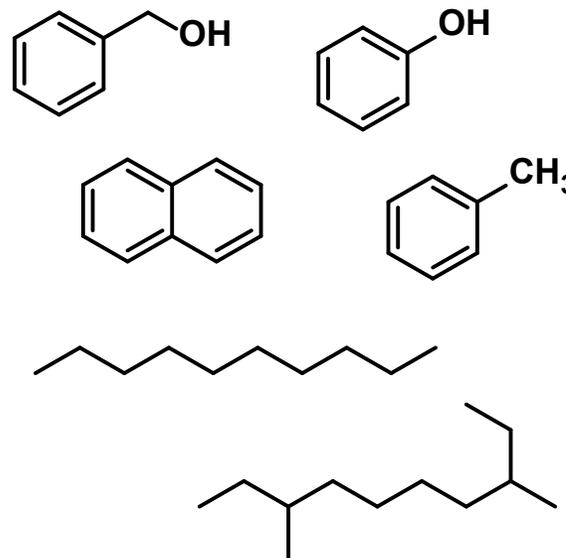

## Injected Chemicals

- Surfactants, biocides, etc.
- Listed in FracFocus

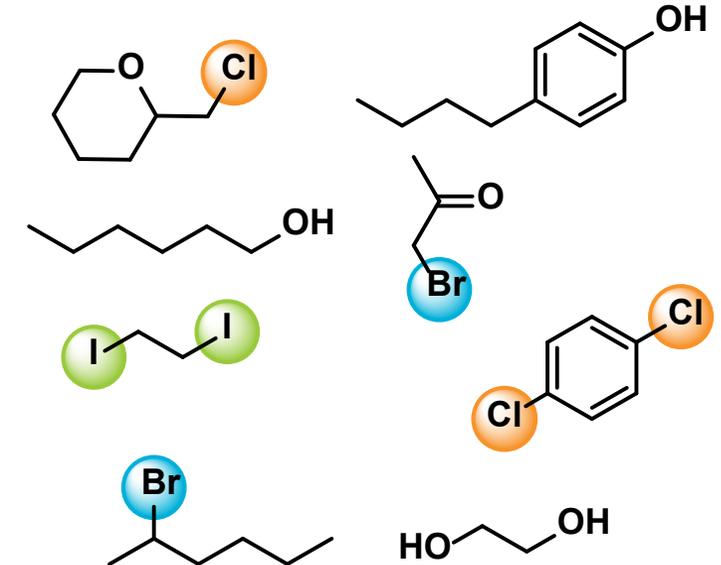

## Subsurface Chemicals

- Phenols, aromatics, hydrocarbons
- Unknown concentrations

## Transformation Products

- Halogenated, alcohols, PEGs
- Unknown concentrations
- High potential toxicity

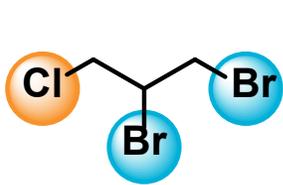

Hoelzer, K.; Sumner, A. J.; Karatum, O.; Nelson, R. K.; Drollette, B. D.; O'Connor, M. P.; D'Ambrio, E. L.; Getzinger, G. J.; Ferguson, P. L.; Reddy, C. M.; Elsner, M.; Plata, D. L.; Indications of Transformation Products from Hydraulic Fracturing Additives in Shale-Gas Wastewater. *Environ. Sci. Technol.*, **2016**, 50, 8036-8048.

# Toxicity of Halogenated Compounds

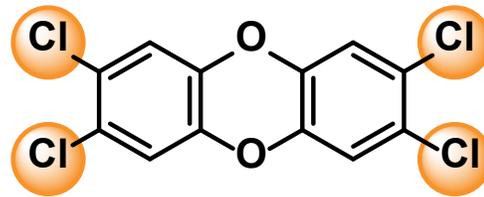

- Halogenated organic compounds are more toxic than their non-halogenated counterparts
- Fat-soluble and not broken down by the body
- Increase in toxicity from Cl < Br < I

## Examples:

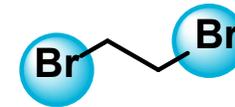

**1,2-dibromo-3-chloro  
propane (DBCP)**

Reproductive difficulties;  
increased risk of cancer  
Limit: 0.002 mg/L

**Dioxin (2,3,7,8-TCDD)**

Reproductive difficulties,  
increased risk of cancer,  
0.00000003 mg/L

**Ethylene Dibromide**

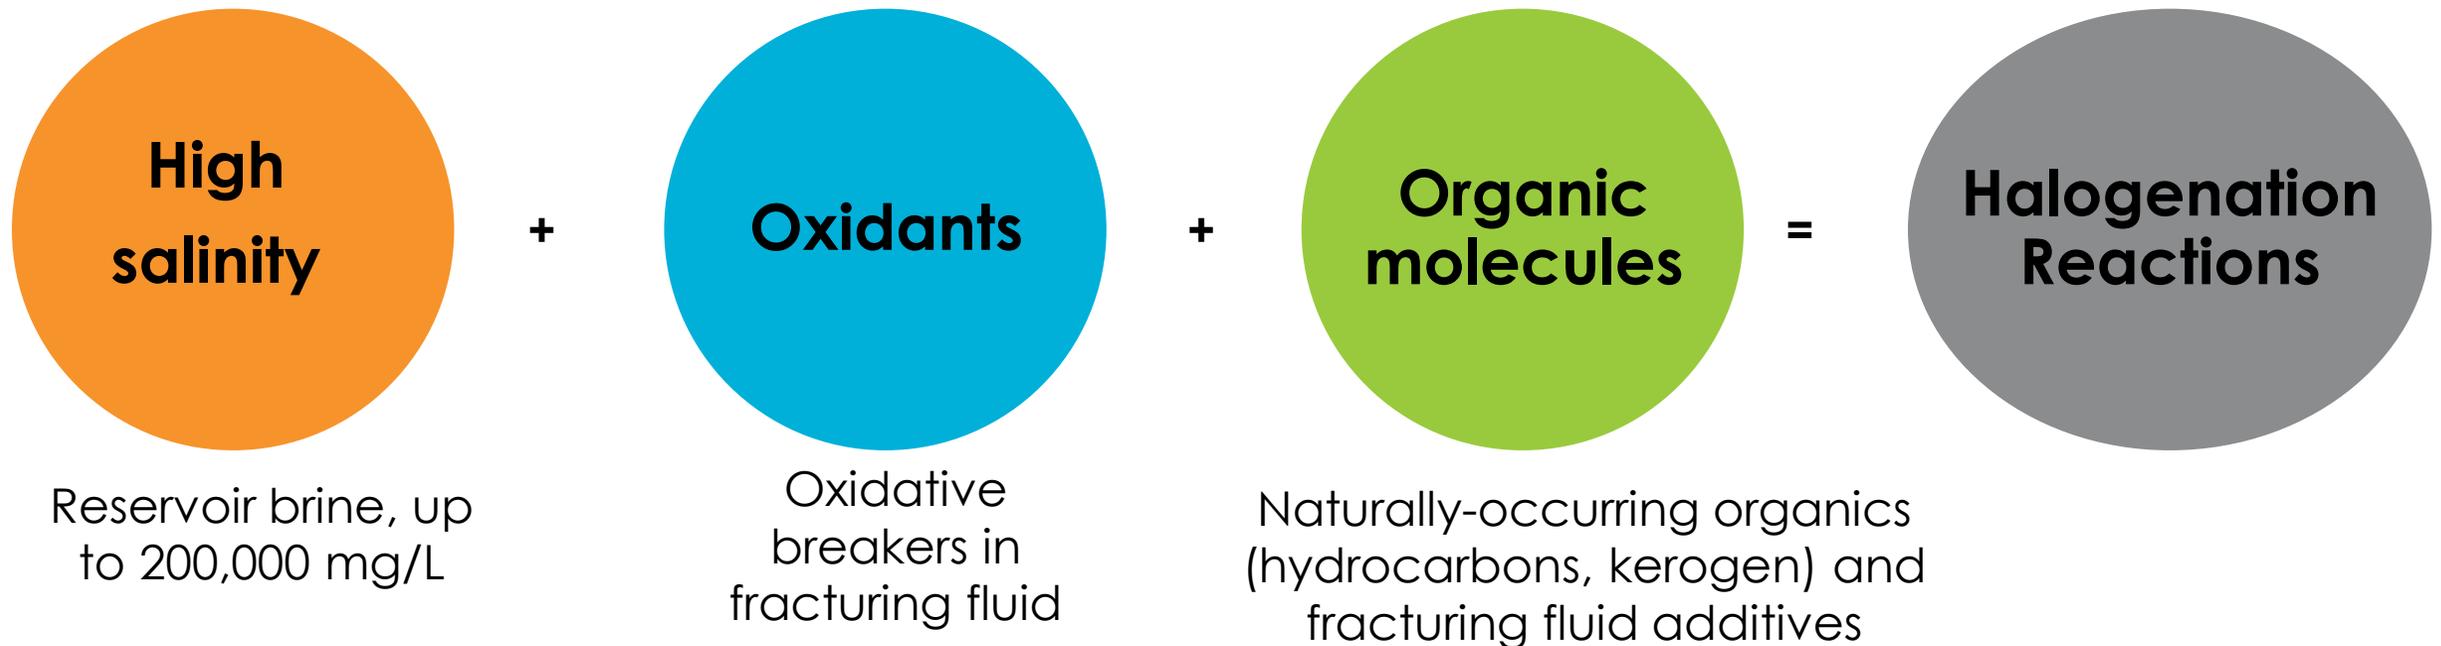

Problems with liver, stomach,  
reproductive system, or kidneys;  
increased risk of cancer  
Limit: 0.00005 mg/L

# What subsurface conditions lead to halogenated transformation products?

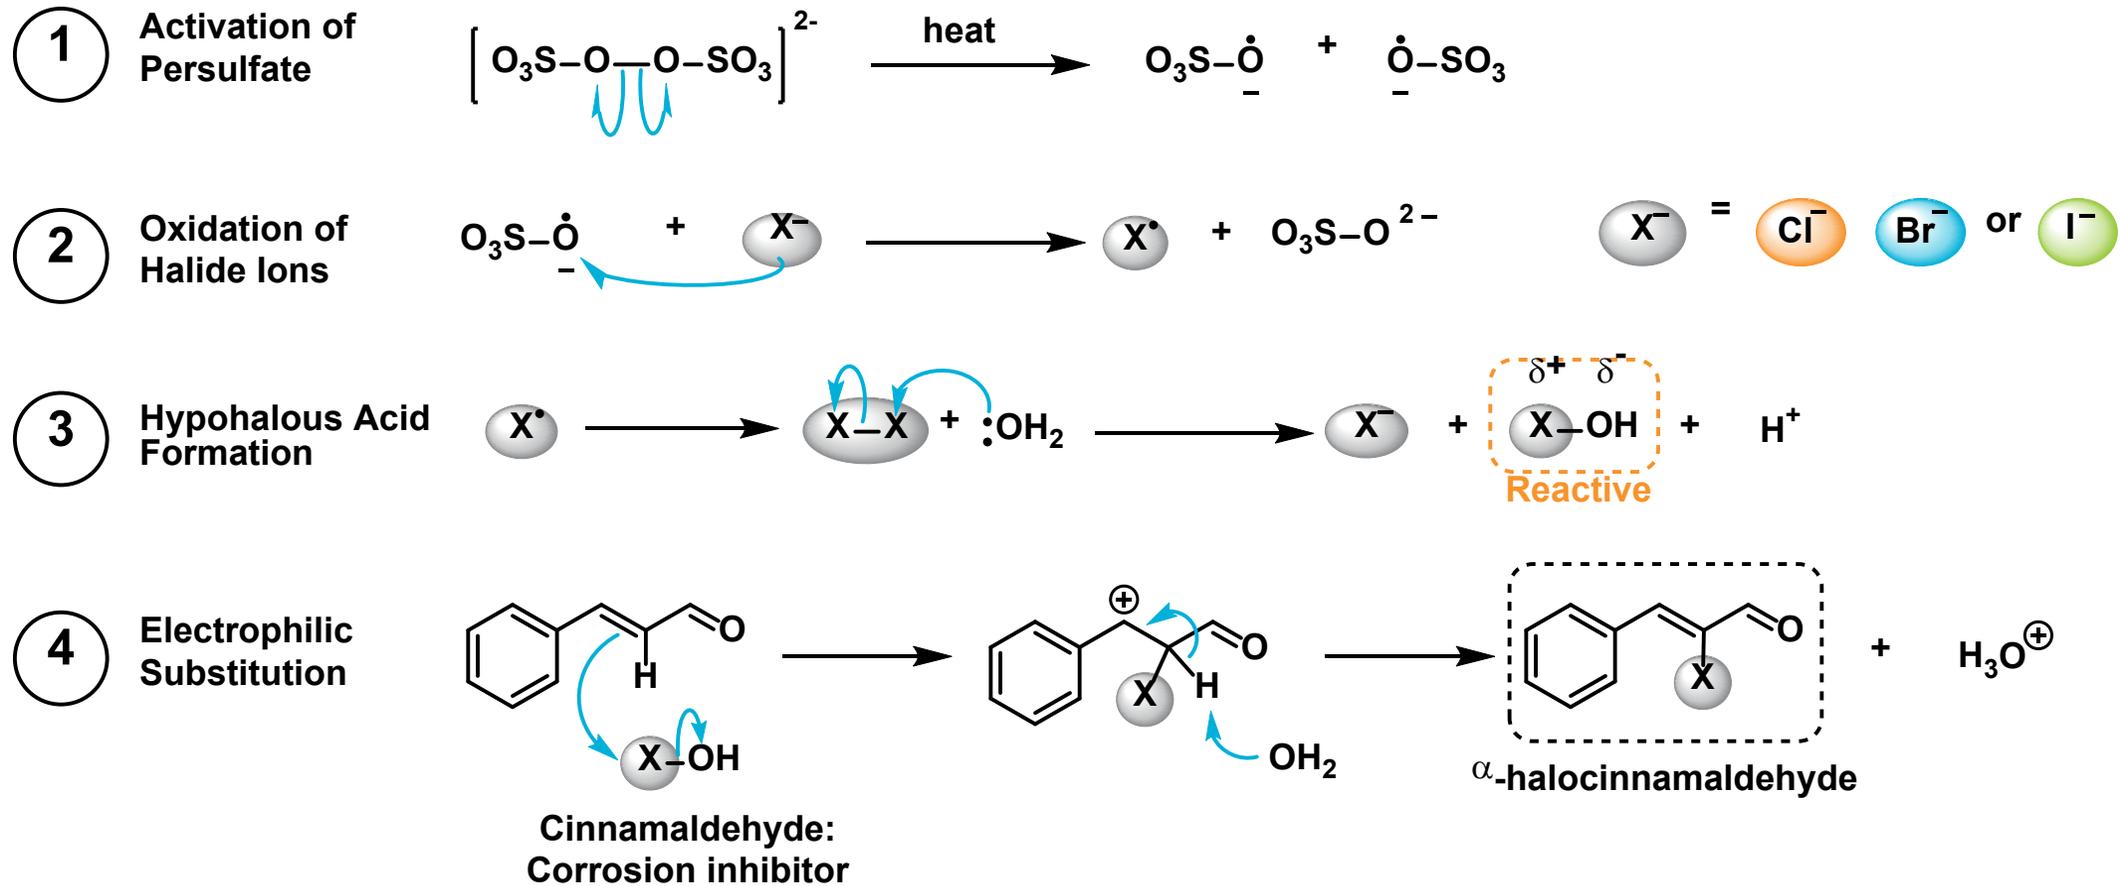

Previously studied by Sumner and Plata, 2018

Andrew J. Sumner; Desiree L. Plata. Halogenation Chemistry of Hydraulic Fracturing Additives under Highly Saline Simulated Subsurface Conditions. *Environ. Sci. Technol.* **2018**, 52, 9097–9107

# Mechanism of Oxidant-Initiated Halogenation Reactions

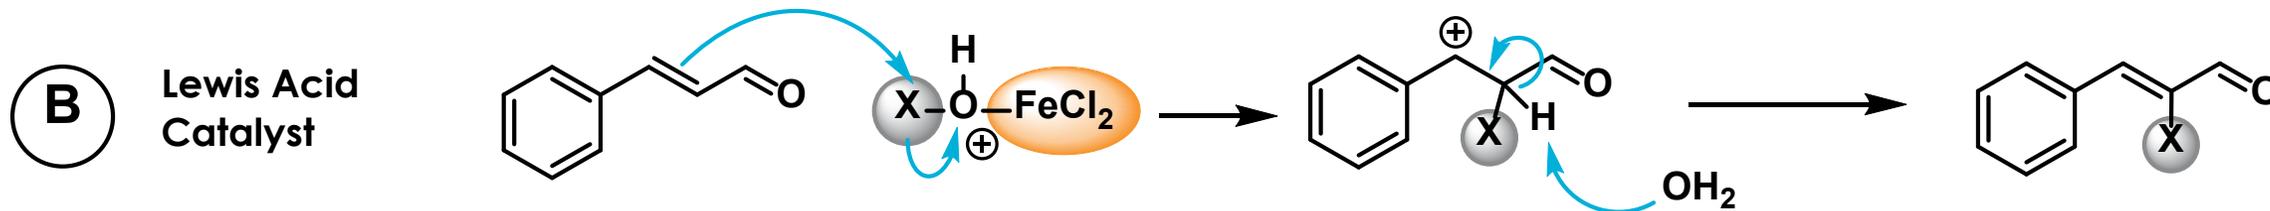

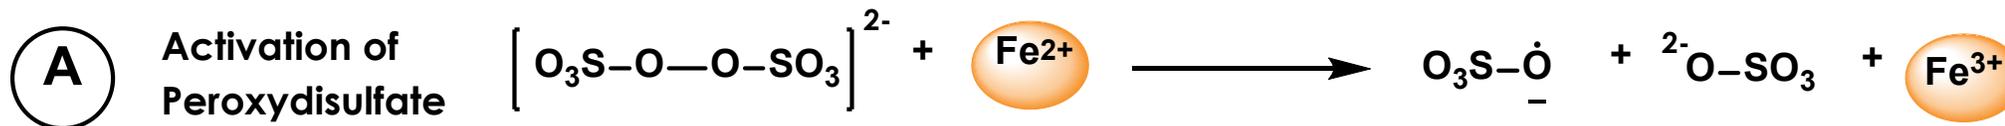

## How do Oxidants, Brine, and Organics React to Give Halogenated Contaminants?

# Research Question: What is the Role of Iron?

Focus of EY22 Q1 and Q2

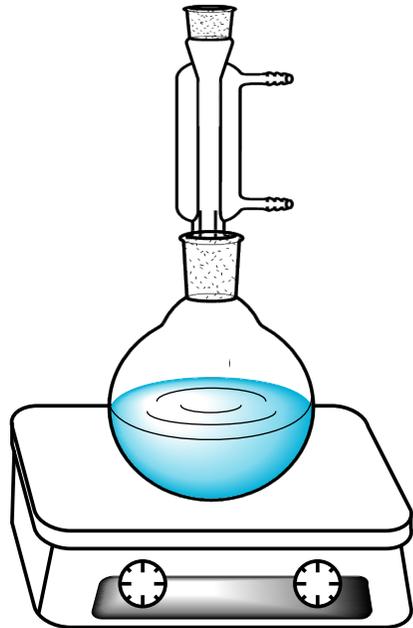

**Hypothesis:** The presence of iron in subsurface shale increases the rate and scope of halogenation reactions

# Goal: Develop Halogenation Rate Constants

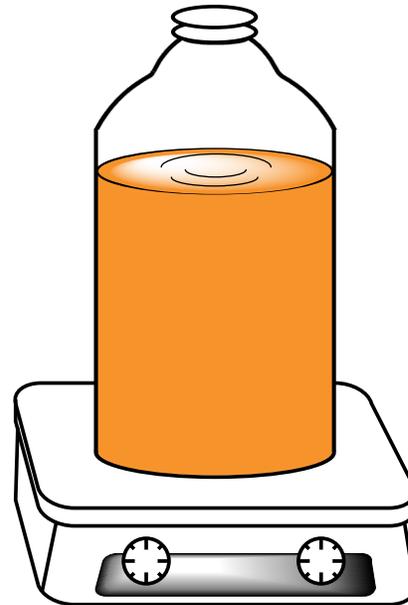

## Phase 1

Model compounds & mineral standards

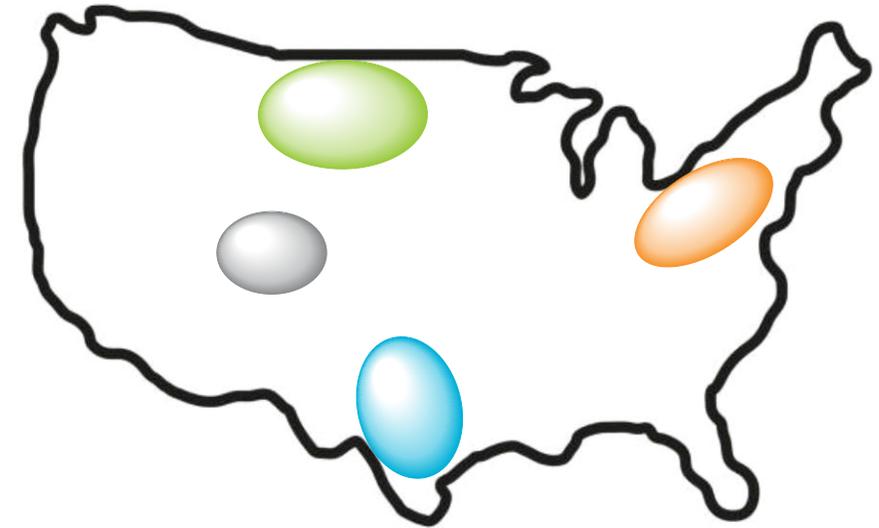

## Phase 2

Geologic samples (kerogen, pyrite, shale powder)

## Phase 3

Geochemical modeling: Basin-specific reaction predictions

# Phase 1 Experimental Plan

## Set Up Reactions in Flasks, Meant to Mimic Subsurface Condition

Oxidative Breakers in frac fluid

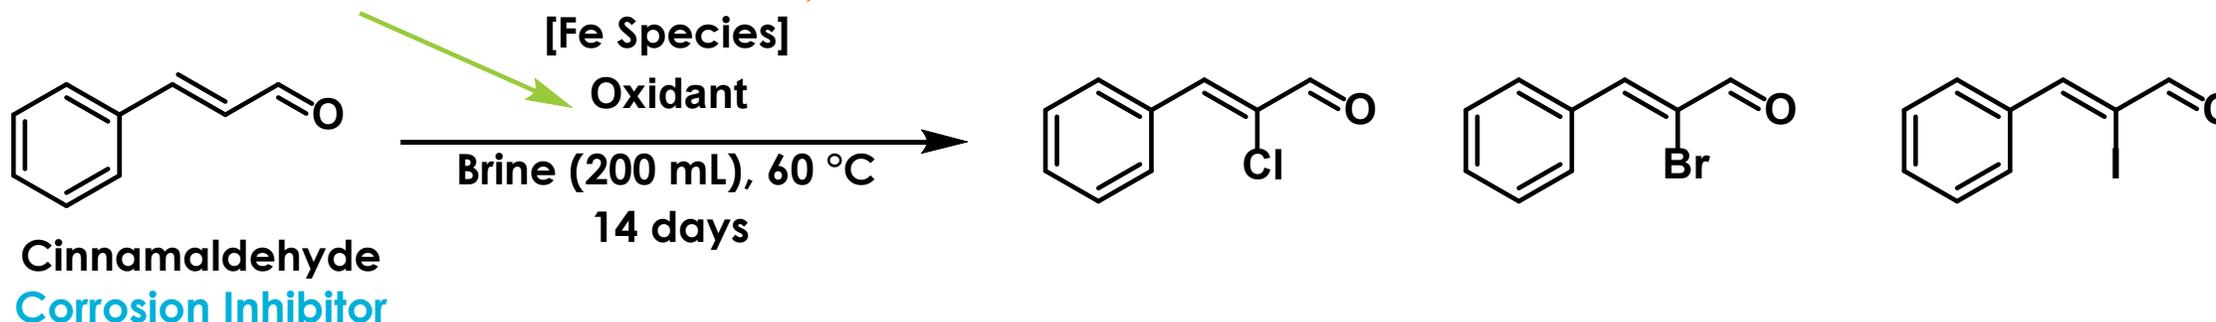

· Tested  $(\text{NH}_4)_2\text{S}_2\text{O}_8$ , NaOCl

Naturally occurring in shale

· Tested No Fe,  $\text{FeCl}_2$ ,  $\text{FeCl}_2$

with citric acid,  $\text{FeCl}_3$

3

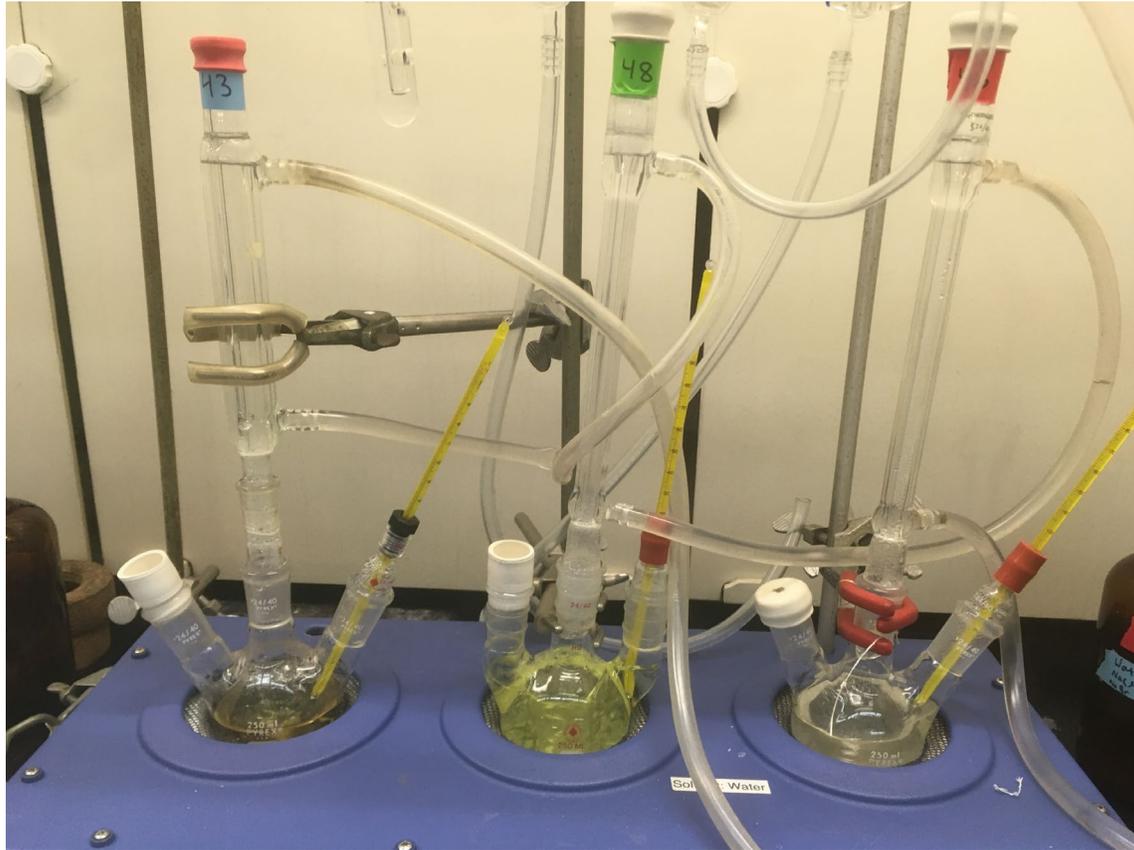

Halide Ions {

Brine Recipe			
$\text{Cl}^-$	50,000 mg/L	$\text{CaCO}_3$	40 mg/L
$\text{Br}^-$	500 mg/L	HCl	pH = 3
$\text{I}^-$	25 mg/L		

# Experimental Procedure

## Redox Geochemistry Lab

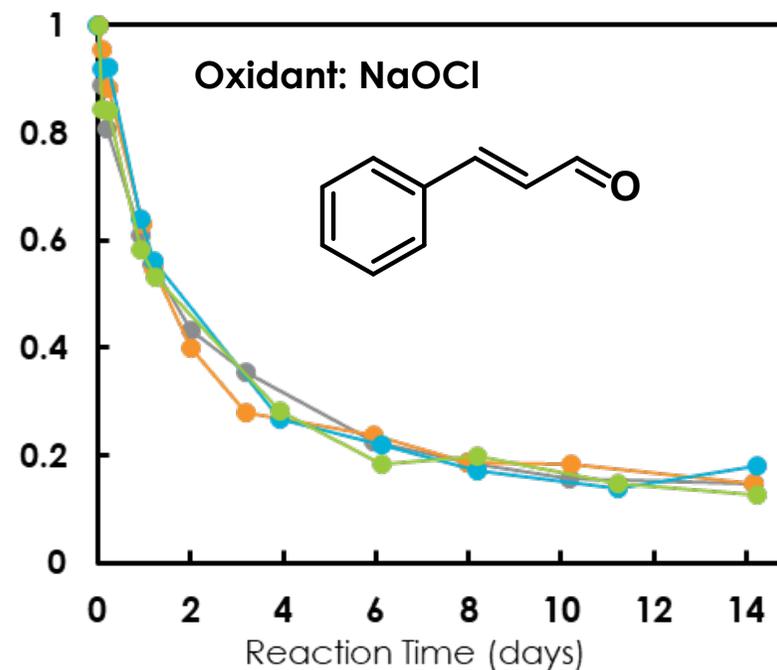

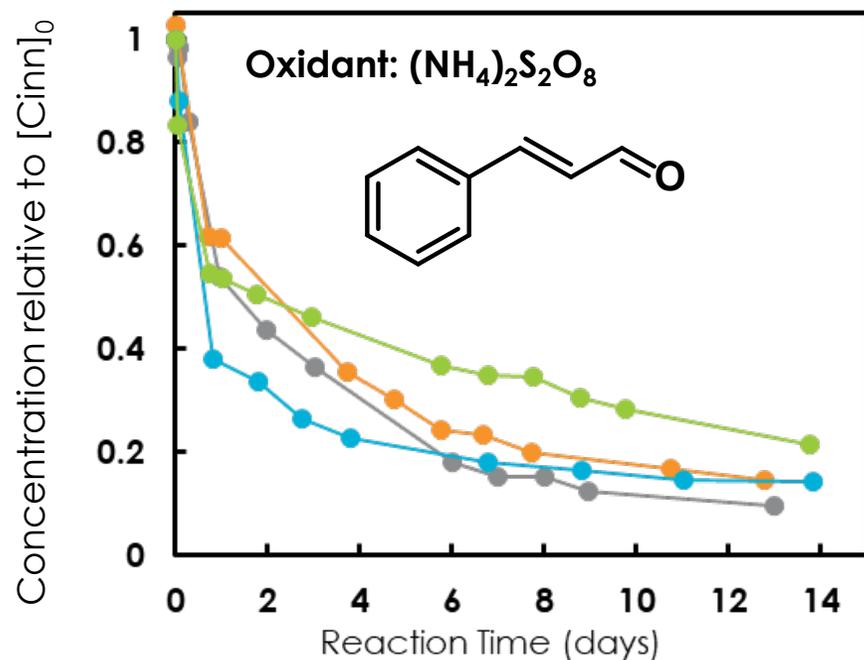

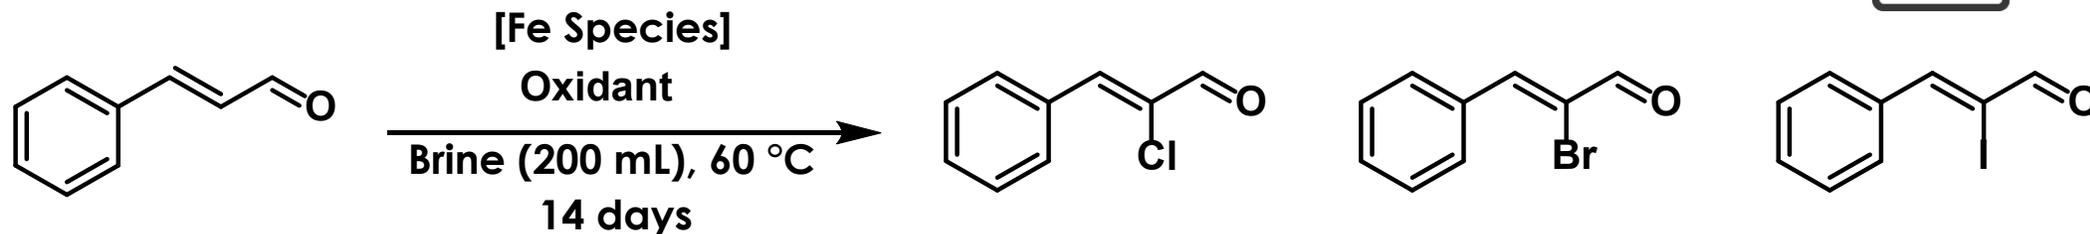

Reaction Setup

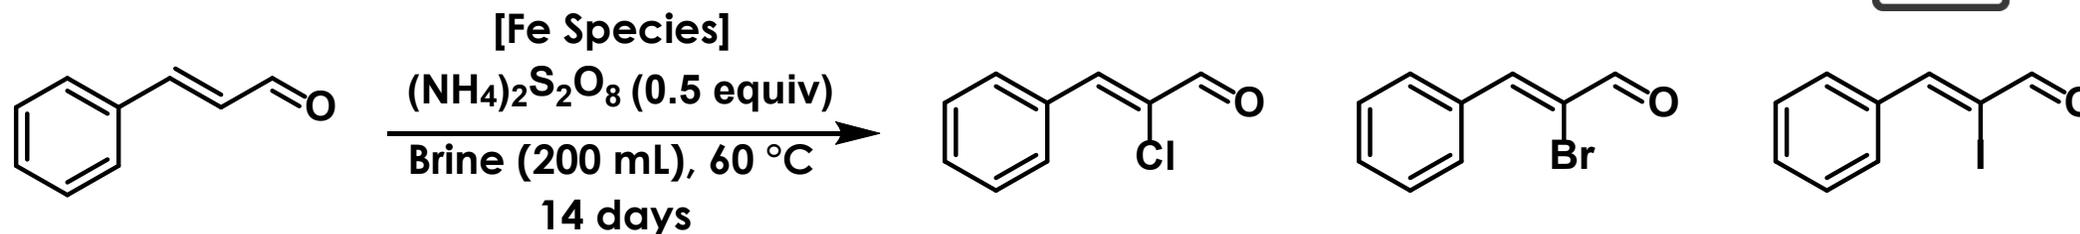

Agilent 7890A GC  
Agilent 5975C MSD

Measured concentrations  
using gas chromatography-  
mass spectrometry

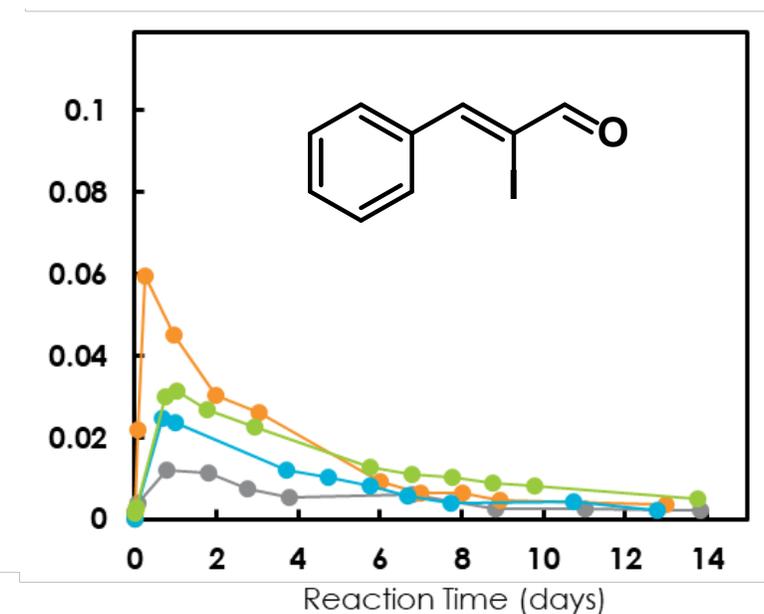

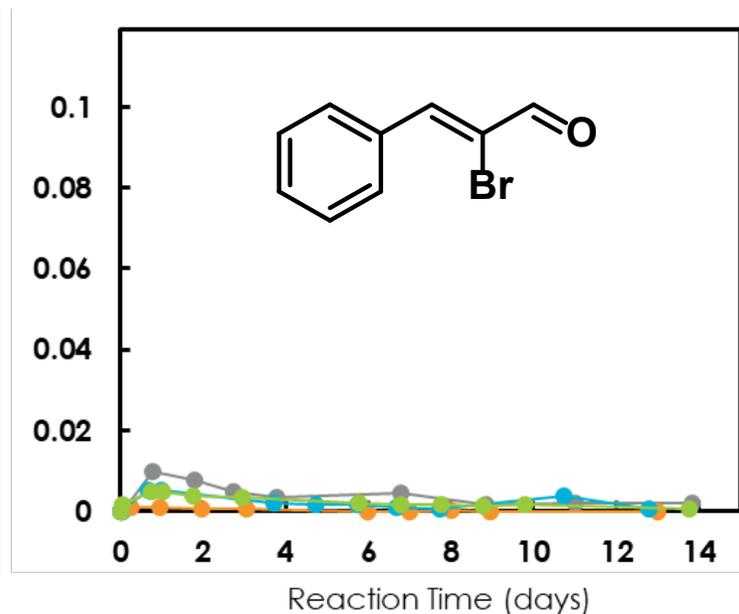

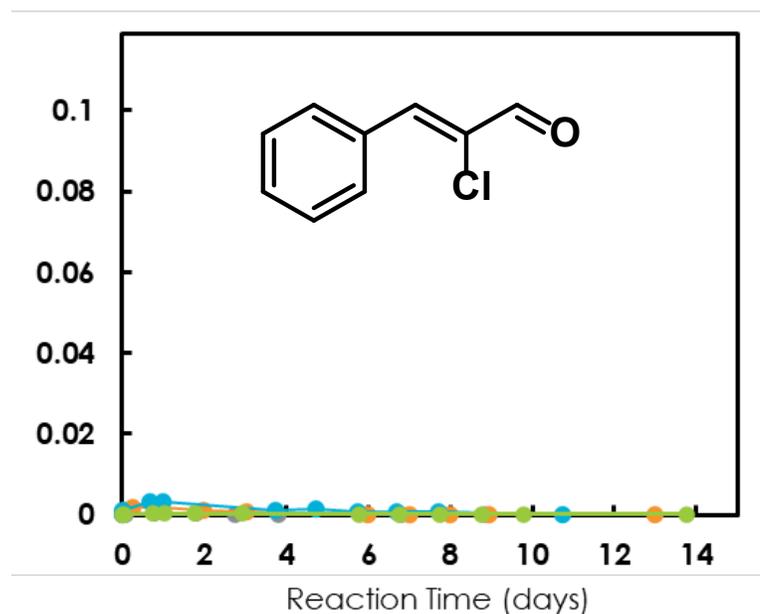

# Results: Degradation of Cinnamaldehyde

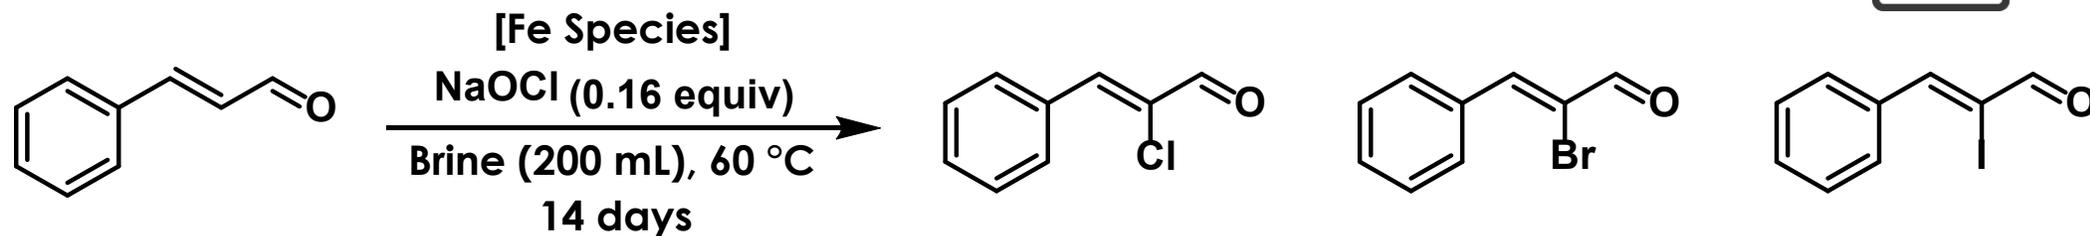

# Results: Halogenation Products, $(\text{NH}_4)_2\text{S}_2\text{O}_8$

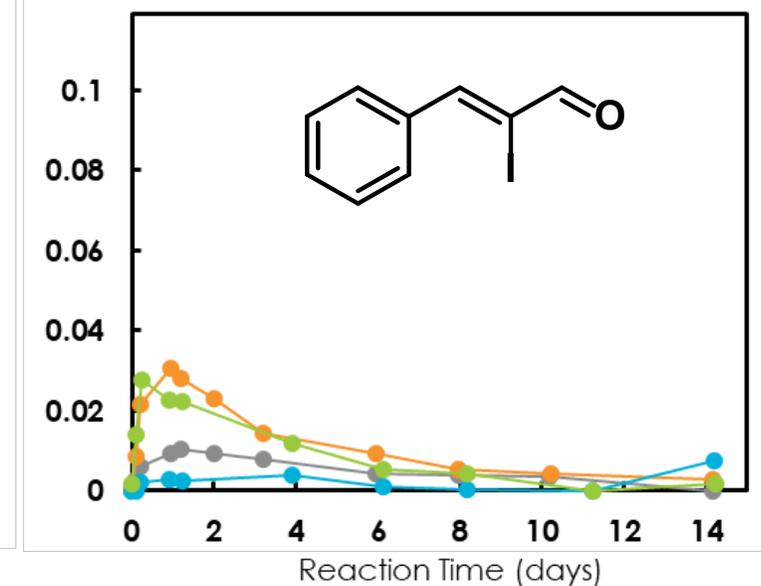

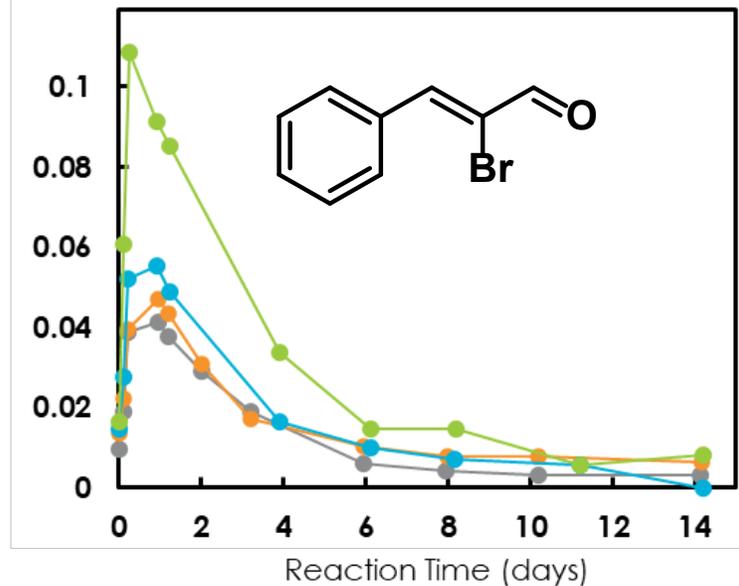

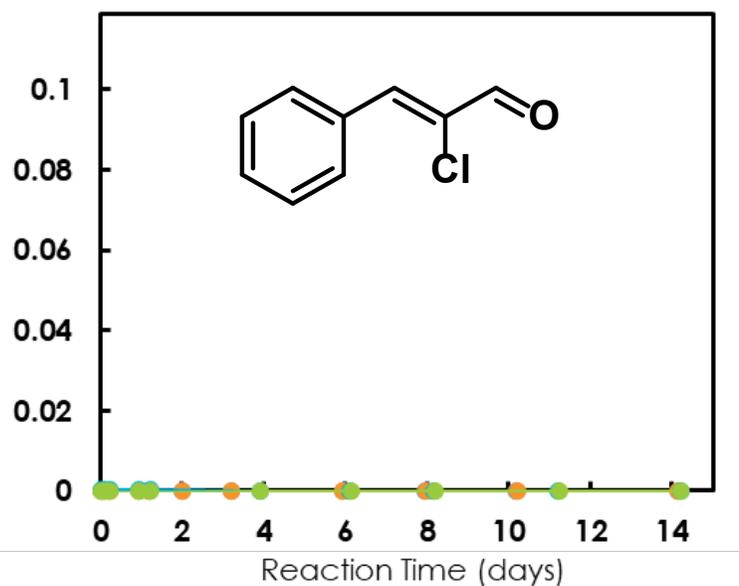

Concentration relative to [Cinn]<sub>0</sub>

# Results: Halogenation Products, NaOCl

Concentration relative to [Cinn]<sub>0</sub>

# Why Do $\alpha$ -Halocinnamaldehydes Decrease Over Time?

- Hypoiodous acid forms and oxidizes quickly

- $\alpha$ -halocinnamaldehydes undergo oxidative degradation

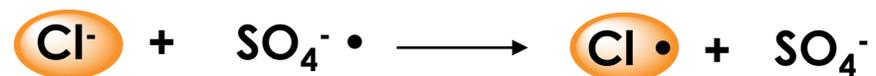

Supported by decrease in TOC over the reaction (540 mg/L to 200-300 mg/L)

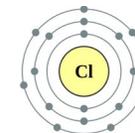

Li, J.; Jiang, J.; Pang, S. Y.; Cao, Y.; Zhou, Y.; Guan, C., Oxidation of iodide and hypoiodous acid by non-chlorinated water treatment oxidants and formation of iodinated organic compounds: A review. *Chemical Engineering Journal* **2020**, 386, 123822.

# Why are iodo- and bromo-cinnamaldehyde formed instead of chloro?

Iodine Radical ( $I\cdot$ ) is Formed  $\sim 100x$  Faster than  $Br\cdot$  and  $\sim 1000x$  Faster than  $Cl\cdot$

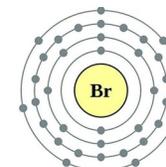

$$3.0 \times 10^8 \text{ M}^{-1}\text{s}^{-1}$$

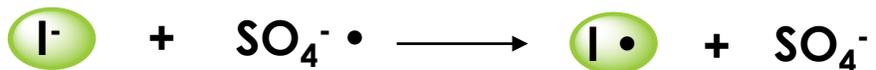

(Peyton 1993)

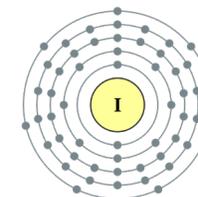

$$3.5 \times 10^9 \text{ M}^{-1}\text{s}^{-1}$$

(Das 2001)

$$3.2 \times 10^{11} \text{ M}^{-1}\text{s}^{-1}$$

(Chen 2012)

Das, T. N., Reactivity and role of  $SO_5^{\cdot -}$  radical in aqueous medium chain oxidation of sulfite to sulfate and atmospheric sulfuric acid generation. *Journal of Physical Chemistry A* **2001**, *105*, 9142-9155.

Peyton, G. R., The free-radical chemistry of persulfate-based total organic carbon analyzers. *Marine Chemistry* **1993**, *41*, 91-103.

# Phase 2: Reactions of Extracted Kerogen

West Virginia University

Extracted Kerogen

$(\text{NH}_4)_2\text{S}_2\text{O}_8$ ,  
 $\text{NaBrO}_4$ , or  $\text{NaOCl}$

→

Brine Recipe			
$\text{Cl}^-$	50,000 mg/L	$\text{CaCO}_3$	40 mg/L
$\text{Br}^-$	500 mg/L	HCl	pH = 3
$\text{I}^-$	25 mg/L		

- Elemental Analysis:** Extent of kerogen oxidation
- GC-MS:** Types and amount of halogenated compounds
- $^{13}\text{C}$  Solid State NMR:** Mechanism of kerogen oxidation
- ICP-MS:** Inorganic contaminants and critical minerals

# Summary and Implications for Produced Water Treatment

- Iodinated and brominated contaminants may be formed in higher amounts in produced water than previously expected.
- High-salinity brine that contains I<sup>-</sup> and Br<sup>-</sup>, in the presence of oxidants, is susceptible to generation of toxic contaminants.
- The results so far with cinnamaldehyde show that the halogenated compounds form and then degrade.
- Rates of formation and degradation are important for understanding water toxicity.
- Water treatment using Fe should be avoided (or carefully timed).

# Thank you!
