# **Motivation**

- Millions of active and abandoned wells in the United States
- Historic overlap between drilling and valuable formations for GCS
- Well integrity is a potential leakage risk that varies spatially among well types, configurations, and construction
- Generally poor documentation of well construction, use, and integrity history

Need to understand drivers of well integrity issues to better characterize leakage risks

#### **Potential Well Leakage Pathways**

#### • Well integrity

- Controlled production/injection of fluids
- Isolate formation fluids along depth

#### **Potential Well Leakage Pathways**

- Well integrity
  - Controlled production/injection of fluids
  - Isolate formation fluids along depth
- Integrity issues:
  - Improper cement seal
  - Faulty steel casing
  - Fluid invasion from an intermediate

NATIONAL

TECHNOLOGY

#### **Potential Well Leakage Pathways**

- Well integrity
  - Controlled production/injection of fluids
  - Isolate formation fluids along depth
- Integrity issues:
  - Improper cement seal
  - Faulty steel casing
  - Fluid invasion from an intermediate

#### Integrity testing methods:

- Sustained casing pressure (SCP)/casingvent flow (CVF)
- Annular geochemical sampling
- Temperature log, noise log, bond log, pressure fall off tests (SAPT)

#### Study Area - The Wattenberg Field

- Regional well integrity monitoring since 2010
- CO Energy & Carbon Management Commission (ECMC) a leader in data availability
- Annular pressure monitoring and geochemical sampling
- Relatively high frequency of integrity issues

Data availability and integrity challenges make the Wattenberg Field an ideal case study

(Paschke et al., 2011)

#### Integrity Testing Requirements

 Routine inspections for Sustained Casing Pressure (SCP)

U.S. DEPARTMENT OF

- Began in 2010; expanded in 2019
- Pressure check and 30 min bleed-off
- Fluids collected if produced during test

#### **Previous Work**

- <u>2017:</u> Analysis of SCP occurrence and well construction prior to 2016
  - SCP in 13.8% of 3,923 wells tested
  - Logistic regression model (poor performance)

NATIONAL

#### **Previous Work**

- <u>2017:</u> Analysis of SCP occurrence and well construction prior to 2016
  - SCP in 13.8% of 3,923 wells tested
  - Logistic regression model (poor performance)
- <u>2021</u>: Analysis of SCP occurrence prior to 2018 across multiple states
  - SCP in 26.5% of 11,394 wells tested

![](_page_10_Picture_7.jpeg)

VATIONAL

#### **Previous Work**

U.S. DEPARTMENT OF

- <u>2017:</u> Analysis of SCP occurrence and well construction prior to 2016
  - SCP in 13.8% of 3,923 wells tested
  - Logistic regression model (poor performance)
- <u>2021:</u> Analysis of SCP occurrence prior to 2018 across multiple states
  - SCP in 26.5% of 11,394 wells tested
- <u>2022:</u> Analysis of geochemical samples collected from well annuli with respect to well construction
  - Thermogenic gas in 96.2% of 2,148 wells
  - Gas from below cement top in 73.3% of 1,803 wells

Well integrity issues are common in Wattenberg Field and primarily due to barrier failure

![](_page_11_Picture_10.jpeg)

![](_page_11_Picture_11.jpeg)

12

# Expanded Integrity Testing Dataset

- ECMC records gathered through end of 2019
- Dataset expanded:
  - SCP tests from 26,375 wells
  - Geochemical samples from 2,148 wells
- Complementary records gathered from proprietary sources (Enverus)
- 106 attributes that describe:
  - Location, underlying geology, construction, operation, and production history

![](_page_12_Figure_8.jpeg)

![](_page_12_Picture_9.jpeg)

# **Well Integrity Evaluation**

- SCP (Pressure)
  - API RP 90-2
  - 345 kPa (50 psi) diagnostic threshold
  - Pressure did not bleed to zero
  - Bled to zero but multiple tests above threshold
- SCP (Geochem.)
  - Presence of thermogenic gas (C<sub>4+</sub>) hydrocarbons

![](_page_13_Figure_8.jpeg)

![](_page_13_Picture_9.jpeg)

NATIONAL

TECHNOLOGY

### Integrity Issue Occurrence

![](_page_14_Picture_1.jpeg)

- SCP testing expanded to all active wells
- 26.5% (2021) to 17.1%
- 8.2% of wells with thermogenic gas

Category	All Wells (%)				
Tested	26,332				
SCP (Pressure)	4,490 (17.1%)				
SCP (Geochem.)	2,159 (8.2%)				

New data has decreased estimates of percentage of wells with integrity issues

![](_page_14_Figure_7.jpeg)

![](_page_14_Picture_8.jpeg)

### **Spatiotemporal Analysis**

- Getis-Ord GI\* hotspot analysis on percentage of wells in each section
- Yearly percentage of wells that exceed diagnostic threshold

Statistically significant hotspot of well integrity issue occurrence. No significant temporal trend.

NATIONAL ENERGY TECHNOLOGY LABORATORY

![](_page_15_Picture_5.jpeg)

## **Impact of Hot Spot**

Category	All (%)	Vert. (%)	Dev. (%)	Horiz. (%)					
Inside Hot Spot									
Tested	6,914	3,453	1,792	1,627					
SCP	2,614	1,193	816	589					
(pressure)	(37.8%)	(34.5%)	(45.5%)	(36.2%)					
SCP	1,329	557	490	267					
(geochem.)	(19.2%)	(16.1%)	(27.3%)	(16.4%)					
Outside Hot Spot									
Tested	19,418	10,437	2,984	5,919					
SCP	1,876	692	434	740					
(pressure)	(9.7%)	(6.6%)	(14.5%)	(12.5%)					
SCP	830	317	239	263					
(geochem.)	(4.3%)	(3.0%)	(8.0%)	(4.4%)					

#### Greater than three-fold increase in percent of wells with SCP inside the hotspot

![](_page_16_Picture_3.jpeg)

![](_page_16_Figure_4.jpeg)

![](_page_16_Picture_5.jpeg)

# Modeling SCP Occurrence

![](_page_17_Picture_1.jpeg)

![](_page_17_Figure_2.jpeg)

# Model Workflow

- Held out 30% for validation
- Under-sample to balance dataset
- KNN imputation (3.7% of dataset)
- 10-fold cross validation
- Recursive feature drop
- Hyper parameter tuning
- Early stopping
- Target: SCP (geochem.)

![](_page_18_Figure_9.jpeg)

![](_page_18_Picture_10.jpeg)

ENERG

ABORATORY

# Model Performance – All Wells

- Reasonable classification power
- Held-out set:
  - 7,833 wells; 647 (8.3%) with SCP
  - 527 (81.5%) of 647 identified
  - 120 (18.6%) with SCP misclassified
- Favored precision over recall
  - 2,043 false positives
- Reduces wells considered by 67%
  - 20.5% in selected pool have SCP
  - 2.3% in non selected pool have SCP

![](_page_19_Figure_12.jpeg)

![](_page_19_Figure_13.jpeg)

![](_page_19_Picture_14.jpeg)

NATIONAL ENERGY TECHNOLOGY LABORATORY

Model Useful for Risk Assessment

# Importance of Location/Geology

![](_page_20_Figure_1.jpeg)

![](_page_20_Figure_2.jpeg)

• Strong spatial correlation in SCP occurrence among wells

![](_page_20_Picture_4.jpeg)

# Importance of Location/Geology

![](_page_21_Figure_1.jpeg)

- Strong spatial correlation in SCP occurrence among wells
- Wells located in valleys are more likely to exhibit SCP

![](_page_21_Picture_4.jpeg)

NATIONAL

TECHNOLOGY LABORATORY

# Importance of Location/Geology

![](_page_22_Figure_1.jpeg)

- Strong spatial correlation in SCP occurrence among wells
- Wells located in valleys are more likely to exhibit SCP
- Location with respect to faulting, over pressured zones, and thermal maturity also important

![](_page_22_Picture_5.jpeg)

NATIONAL

TECHNOLOGY

### Feature Importance – Location/Geology

![](_page_23_Picture_1.jpeg)

- Highly complex geology nexus of basin axis and wrench fault system
- Aligns with path of St. Vrain Creek, South Platte River, and Longmont Wrench Fault
- Extension overlies region where source rocks have highest thermal maturity

![](_page_23_Figure_5.jpeg)

![](_page_23_Picture_6.jpeg)

# **Incorporating Cement Quality**

- Cement bond logs (CBLs) industry standard for interpreting quality of cement seal between casing and formation
- CBLs available for 18,639 tested wells in the Wattenberg Field

![](_page_24_Figure_3.jpeg)

![](_page_24_Figure_4.jpeg)

![](_page_24_Picture_5.jpeg)

# **Incorporating Cement Quality**

![](_page_25_Picture_1.jpeg)

- Cement bond logs (CBLs) industry standard for interpreting quality of cement seal between casing and formation
- CBLs available for 18,639 tested wells in the Wattenberg Field
- CBLs downloaded for 13,464 wells

Sufficiently large dataset to identify relationships between cement quality and well integrity issues

![](_page_25_Figure_6.jpeg)

![](_page_25_Picture_7.jpeg)

#### **Bond Log Data**

#### • .LAS Files

- Amplitude
- CCL
- Gamma Ray

#### • PDF files:

- Amplitude:
- VDL

### **Bond Index Calculation**

- Gather amplitude data from .las files
- Identify cement top
- Identify amplitude for 100% and 0% bond
- Calculate the bond index (BI) score
  - Good: 0.8-1
  - Mid: 0.6-0.79
  - Poor: 0.4-0.59
  - Worst: 0.0-0.4
- Derive cement quality parameters

![](_page_27_Picture_10.jpeg)

![](_page_27_Figure_11.jpeg)

![](_page_27_Figure_12.jpeg)

 $BI = \frac{Attenuation Measured Bond Index}{Maximum Attenuation}$ (Bigelow, 1990)

![](_page_27_Picture_14.jpeg)

#### **CBL Model Parameters**

![](_page_28_Figure_2.jpeg)

![](_page_28_Picture_3.jpeg)

![](_page_28_Figure_4.jpeg)

![](_page_28_Picture_5.jpeg)

### **Ensemble Decision Tree Approach**

- Ensemble decision tree model
- CBL data only model & combined model
- Confounding variables
  - Pressure applied during CBL
  - Eccentricity
  - Expert judgement

![](_page_29_Figure_7.jpeg)

![](_page_29_Picture_8.jpeg)

NATIONAL ENERGY

TECHNOLOGY

# **Alternative Modeling Approaches**

#### Long Short-Term Memory Networks

![](_page_30_Picture_2.jpeg)

The current state of the LSTM unit and "outputs" (hidden state) are used as inputs for the next interval of data

![](_page_30_Figure_4.jpeg)

![](_page_30_Picture_5.jpeg)

- Architecture designed for sequential data (speech, text, sensor, financial)
- Sequential data processing preserves the order of the data
- Challenges:
  - long sequences
  - variable length
  - variable resolution (0.5' vs 1' intervals)

![](_page_30_Picture_12.jpeg)

NATIONAL

TECHNOLOGY LABORATORY

# **Model Application for GCS**

![](_page_31_Picture_1.jpeg)

#### GCS in the Denver Basin

- The Denver Basin contains 70% of all CO<sub>2</sub> storage capacity in Colorado
- 82 screened candidate oil and gas reservoirs in 31 fields have a total estimated capacity of 505 MMT and an average of 6.2 MMT per field (McPherson, 2006)

![](_page_31_Figure_5.jpeg)

(McPherson, 2006)

![](_page_31_Picture_7.jpeg)

# **Model Application for GCS**

#### GCS in the Denver Basin

U.S. DEPARTMENT OF

- The Denver Basin contains 70% of all CO<sub>2</sub> storage capacity in Colorado
- 82 screened candidate oil and gas reservoirs in 31 fields have a total estimated capacity of 505 MMT and an average of 6.2 MMT per field (McPherson, 2006)
- Potential formations include Terry and Hygiene Sandstone, Niobrara, Codell, Greenhorn Limestone, Muddy Sandstone, Dakota and Lakota

![](_page_32_Figure_5.jpeg)

(Drake et al., 2014)

![](_page_32_Picture_7.jpeg)

NATIONAL ENERGY

TECHNOLOGY LABORATORY

# **Model Demonstration**

#### **Case Study GCS Site Selection**

![](_page_33_Figure_2.jpeg)

#### GCS Case Study - Wattenberg

- Wattenberg field provides the largest capacity in the Denver basin at an estimated 352 MMT (Drake et al., 2014) and presence of CO<sub>2</sub> emitters with stacked formations makes it a good candidate for GCS (Ning and Tura, 2022)
- Existing wells in the field create potential leakage pathways
- Regional well integrity monitoring data and predictive models are valuable for site selection and corrective action planning

![](_page_33_Picture_7.jpeg)

NATIONAL ENERGY TECHNOLOGY LABORATORY

# Conclusions

![](_page_34_Picture_1.jpeg)

- Well integrity can be forecasted with regulatory records
- Geology is a primary driver of oil and gas well integrity issues in the Wattenberg Field of Colorado
- SCP monitoring programs help identify regions with a high risk of well integrity issues and provide valuable insight for future GCS operations

# **Next Steps**

- Incorporate CBL data in ensemble decision tree modeling approach
- Explore LSTM approach
- Develop GCS case study in the Wattenberg Field that demonstrates value of regional integrity monitoring data and predictive modeling approach for GCS
