Battelle Disclaimer

Battelle does not engage in research for advertising, sales promotion, or endorsement of our clients' interests including raising investment capital or recommending investments decisions, or other publicity purposes, or for any use in litigation. Battelle endeavors at all times to produce work of the highest quality, consistent with our contract commitments. However, because of the research and/or experimental nature of this work the client undertakes the sole responsibility for the consequence of any use or misuse of, or inability to use, any information, apparatus, process or result obtained from Battelle, and Battelle, its employees, officers, or Trustees have no legal liability for the accuracy, adequacy, or efficacy thereof.

Project Overview

Funding: (\$8.1M DOE, \$2.0M Cost Share)

Performance Dates: 2 years
(October 2023 to September 2025)

DOE/NETL Project Manager: Nick Means

Project Team: *Battelle* (Research Institute in Columbus, Ohio)

DTE Energy (DTE) (Detroit-based diversified energy company serving 2.3 million electric & 1.3 million natural gas customers)

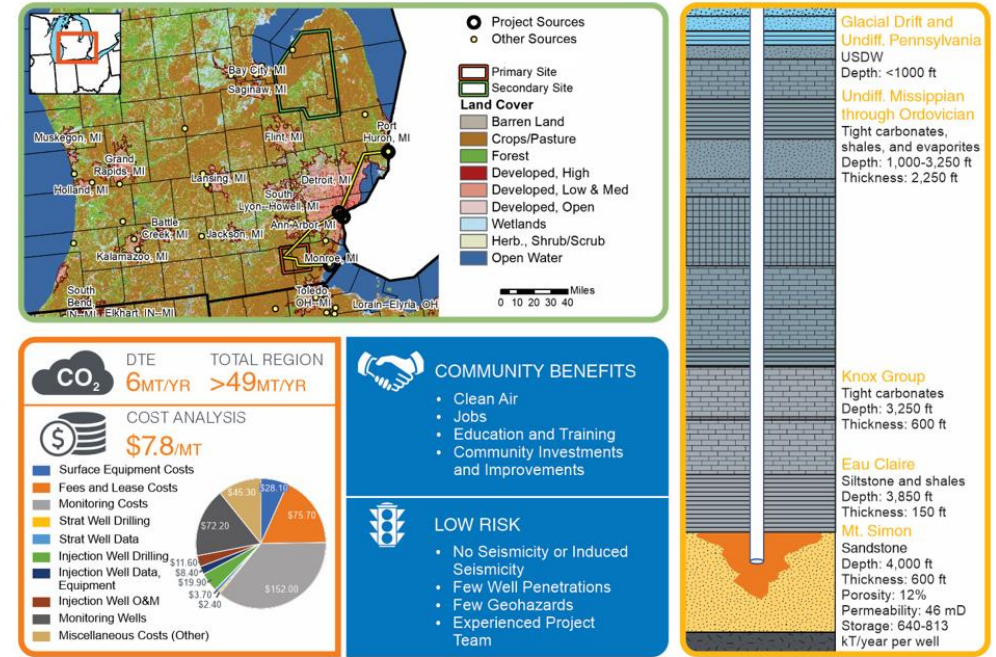

Objective: Develop an integrated commercial-scale storage complex capable of storing 63-million tonnes CO₂ in saline formations within 30-years in the Southeastern region of the Michigan Basin.

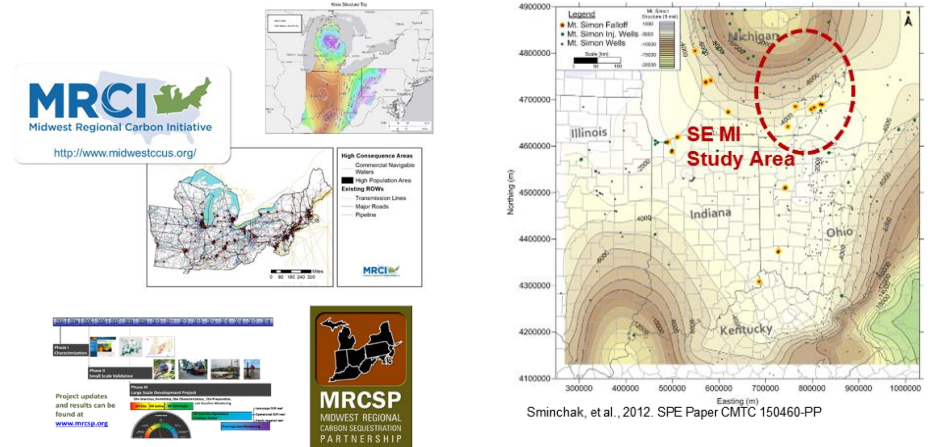

- **Storage Hub** – Southeastern MI
- **Storage Site** – SE Michigan site, or alt. northern SE Michigan site
- **CO₂ Sources** – Blue Water Energy Complex (BWEC), St. Clair County, 3 MT/yr, potential future CCGT w/CCS ~3 MT/yr
- **Additional Sources** – numerous sources along I-75 corridor 5MT/yr.

Background

- Battelle and DTE are teaming to evaluate CO₂ storage hub feasibility for power generation and other emitters in SE Michigan.
- The project builds on collaborations between Battelle, Midwestern Regional Carbon Sequestration Partnership, Midwest Regional Carbon Initiative, & a previous CarbonSAFE Northern Michigan Basin Phase I project.
- A previous evaluation was also completed by Battelle Carbon Services for DTE to determine the feasibility of commercial-scale storage in Southeastern Michigan.

Reducing Risk, Advancing Technology, and Supporting Growth

Project Benefit to DOE Program Goals

- **Supports** DOE FECM programmatic goals to develop industrial scale CarbonSAFE hubs to help reduce greenhouse gas emissions, develop skilled workforce, and support carbon capture implementation.
- **Provides** 63 million metric tons of secure carbon storage to a key industrial area along I-75 corridor by 2030 with power generation, refining, chemical facilities, steel plants, hydrogen.
- **Progresses** CO₂ storage from SRMS prospective storage volume to contingent storage resource with a 4,600 ft deep stratigraphic test well, analysis of ~200 miles of 2D seismic data, design of safe CO₂ storage system, and risk mitigation measure for a CO₂ storage hub.
- **Benefits** communities in areas with skilled workforce development needs, underserved communities, investments in energy transition.

The Pathway to Net Zero Emissions **DTE**

Retiring coal-fired power plants

Adding thousands of megawatts of wind and solar power

Incorporating natural gas to balance more renewables

Investing in carbon capture, large-scale storage, and modular nuclear facilities

Expanding our voluntary renewable energy programs like MIGreenPower and Natural Gas Balance

Advocating for constructive public policy

People - Improving lives and creating opportunity

Places - Partnering with communities for growth

Planet - Leadership toward cleaner energy and environmental stewardship

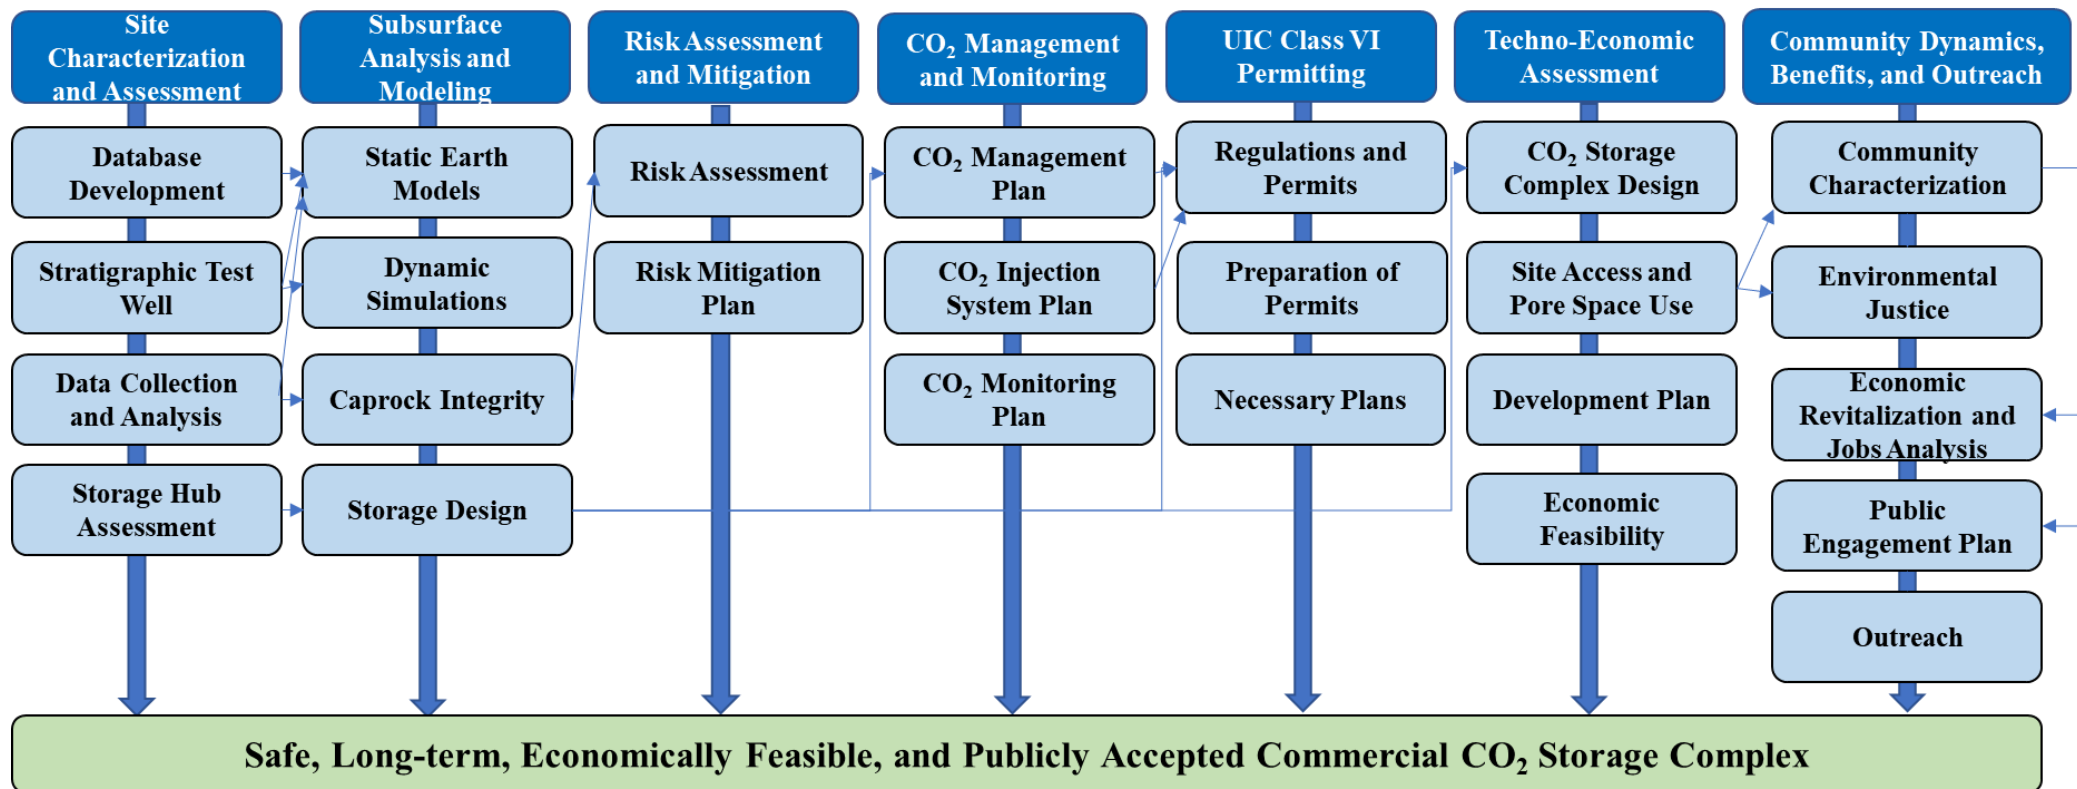

Progress - Powering towards a brighter tomorrow

Technical Approach

Technical Approach includes 7 tasks designed to ensure safe, long-term, economically feasible, and publicly accepted commercial CO₂ storage complex.

Technical Task Organization

Community Benefits Plan

GOAL: Focus on areas with skilled workforce development needs, underserved communities, and needs for investments in energy transition.

Potentially impacted communities: Lenawee, St. Clair, Wayne, Washtenaw, Monroe Counties MI

- 10 of 11 counties in SE MI have DACs - cumulative impacts – poor economic, environmental, social, & health indicators
- Nearest DAC to proposed hub approx. 12 miles SW in Lenawee County
- Many DACs in SE MI highly dependent on fossil fuel industry for employment

Regional Subsurface Characterization

- Geotechnical database created March 2024
- Subsurface maps provide a reasonable trend guide until seismic and faults are integrated into interpretation

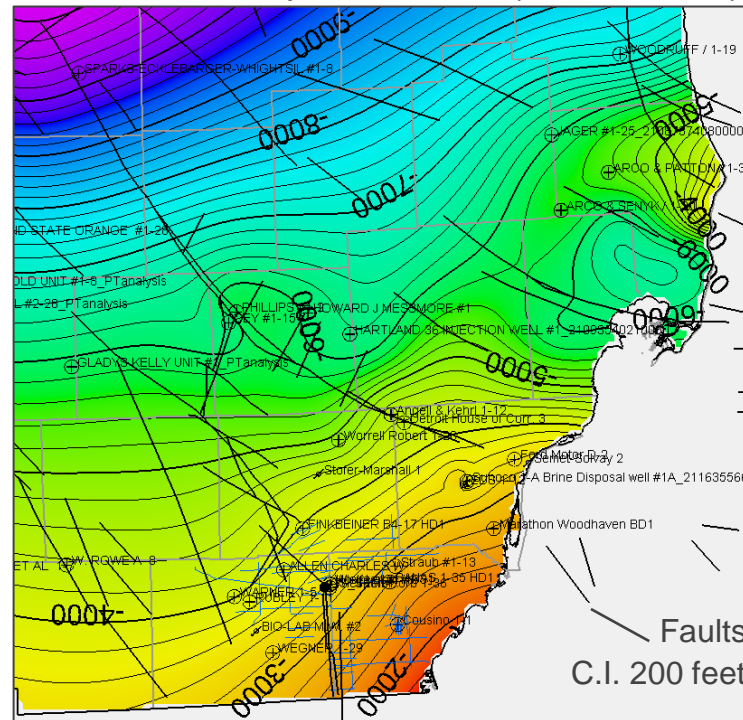

- Mt. Simon deepens to the Northwest
- Mt. Simon thickens to the West

- Significant uncertainty until all subsurface data are integrated

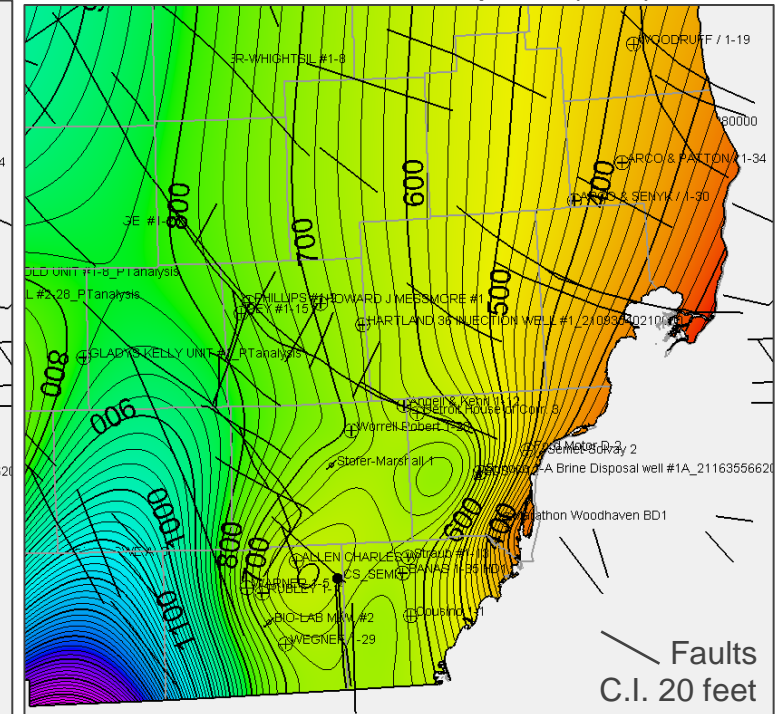

• Geotechnical Database

- Log data, driller data/interpretations
- Available seismic line locations
- Faults and lineaments
- Core data
- Injection well data
- Battelle interpretations of cross sections
- Purchased core data, Seismic data (non-public)

Mt. Simon Depth Structure (SSTVD, feet)

Mt. Simon Isopach (feet)

Integration of Gravity and Magnetic Maps

- Possible insights to help guide geologic interpretations and best STW location
 - Avoid Precambrian highs (Livingston County)

J. Esch, 2009

- Similar anomaly identified on magnetic and gravity data maps
- Coupled with log data indicates a paleo-high

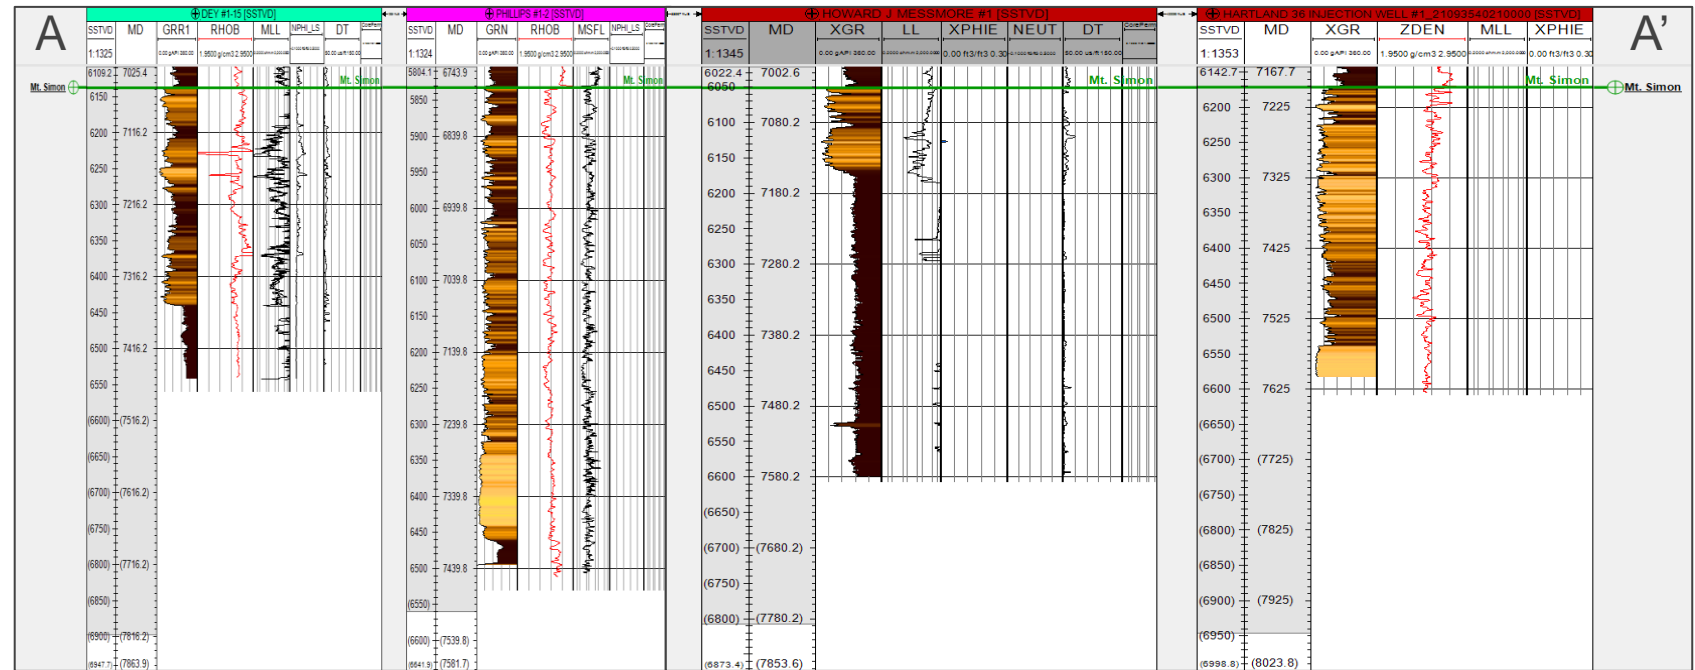

J. Esch, 2010

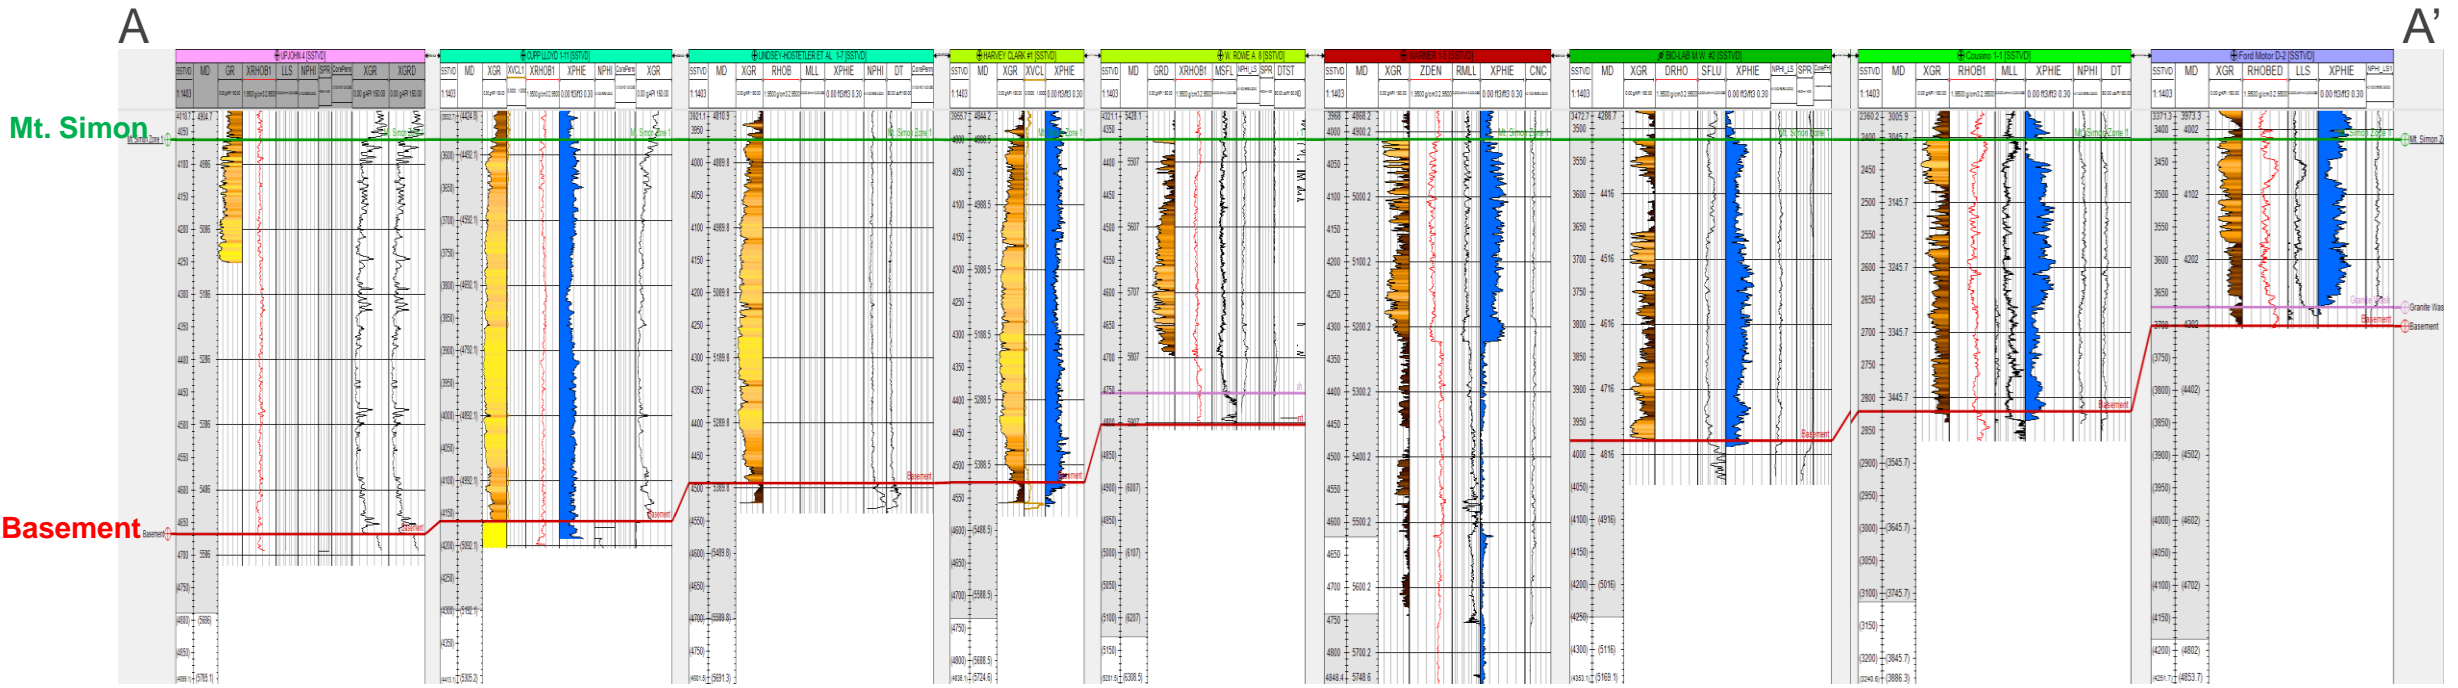

Paleo-highs & lows

- Paleo-highs and Paleo-lows are difficult to identify location or delineate shape
- Known paleo-high in Livingston County appears to correlate to magnetic data
- If correlation is valid, the shape and size can be estimated

Mt. Simon Depositional Changes Across Michigan

- Continued scrutiny of data has not revealed the exact intersection of the different depositional systems
- Integration to seismic observations occurs at a local scale

Legacy vs Reprocessed Data

- Acquired by Shell in 1986; reprocessed by SEI in 2015
- Vibroseis source -60 fold
- High frequency results
- More detail in faulted areas
- Lateral amplitude variation & character

Seismic data owned or controlled by Seismic Exchange, Inc.; interpretation is that of Battelle

2D Identification of faults

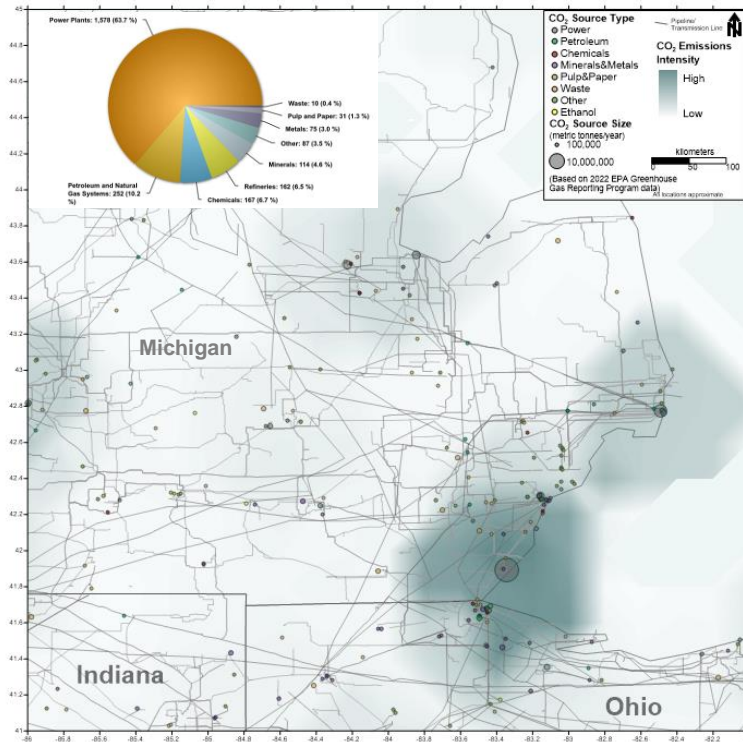

- More structurally complex than base map representation
- Some faulting extends into shallow sections
- STW location is pending ongoing seismic interpretation and integration with other subsurface data

Seismic data owned or controlled by Seismic Exchange, Inc.; interpretation is that of Battelle

Subsurface Modeling and Analysis: Source Assessment

- Hub assessment source assessment completed to delineate CO₂ source specifications, potential for capture retrofit, and options for connecting to CO₂ storage hubs in SE MI.

CO₂ Source Assessment

CO₂ Capture Techno-Economic Assessment

CO ₂ Ranking	1	1.7 million tons CO ₂ /yr
	2	Between 0.3-1.7 million tons CO ₂ /yr
	3	0.3 million tons CO ₂ /yr
Purity Ranking	1	75-100 CO ₂ mol %
	2	25-75 CO ₂ mol %
	3	0-25 CO ₂ mol %
Cost	1	\$0-25 per tCO ₂
	2	\$25-40 per tCO ₂
	3	\$40+ per tCO ₂
Technology	1	Technology is in use
	2	Some technology development
* Uncertain development	3	Little technology development
Age	1	0-25 years
	2	25-50 years
	3	50+ years

Facility/Plant name	County	State	Industry/Primary Fuel	Industry Sector	Total annual CO ₂ emissions (tonnes)	Technology Rank	Purity Rank	Cost Rank	CO ₂ Emission Rank	Age Rank	Overall Rank (with age)	Overall Rank (with age)	Additional notes

Risk Assessment and Mitigation

- Risk analysis completed to prioritize individual project risks for analysis or action by assessing their probability of occurrence & impact for **subsurface**, non-technical, **surface** items.
- Key benefit of this process is that it focuses efforts on high-priority risks throughout the project.

FMEA Example

FMEA — Failure Mode and Effect Analysis Procedure
 QP-10
 Revision Date: 2/10/2023
 Process Owner: C. Goodman

BATTELLE

FMEA Example

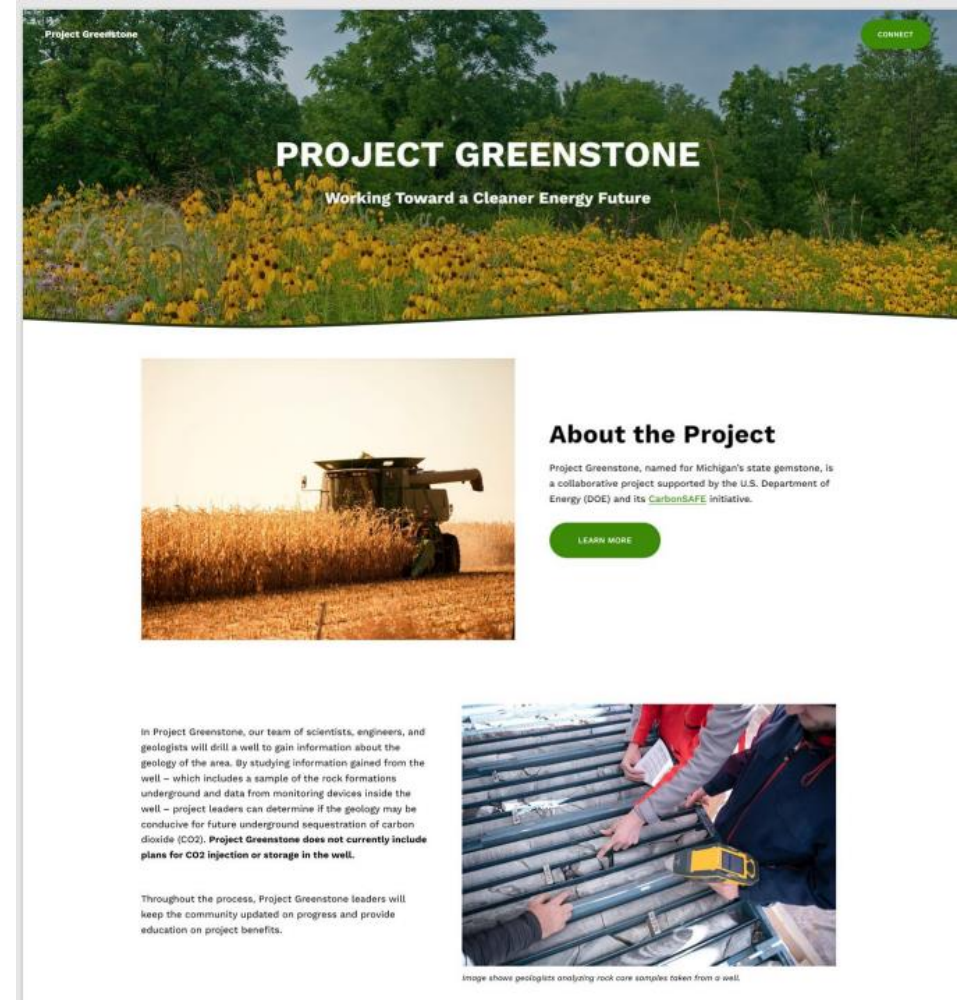

Process Step	Requirement	Potential Failure Mode	Potential Effect(s) of Failure	Severity	Potential Cause(s) of Failure	Current Process			Recommended Action	Responsibility & Target Completion Date	Action Status

2	3	4	5	6	7	8	9	10	11	12	13	14	
Injection Zone Presence	YPS = 35,000 ppm	Injection zone not at window	no project - or expand existing aquifer	30									

7. Potential Cause(s) of Failure
8. Occurrence
9. Current Process Controls
10. Detection
11. Risk Priority Number
12. Recommended Actions
13. Actions Taken
14. Action Results

Stakeholder Outreach

To date, we have:

- Formed internal Engagement Team with DTE
- Designed and built project website (not live) with email address for two-way engagement
- Implemented engagement tracking
- Drafted a project fact sheet
- Participated in unique DEIA training session
- Drafted a Community Open House plan
- Scheduled "boots on the ground" visit to proposed site
- Conducted initial EJ Assessment
- Identified tentative "fenceline" neighbors

CO₂ Management, Monitoring, Class VI Permitting, Techno-economic assessment (scheduled later in project)

- Initial discussions with Michigan Environment, Great Lakes, and Energy for stratigraphic test well plan and Class VI permit process.
- Preliminary techno-economic analysis of CO₂ capture for sources in SE MI.

CO₂ Transportation Options

Transportation

Pipeline without Barging

Pipeline with Barging

Techno-Economic Capture Assessment

Facility/Plant name	County	Industry Type/ Primary Fuel	Industry Sector	Total annual CO ₂ emission (tons)	Technology Rank	Purity Rank	Cost Rank	CO ₂ Emission Rank	Age Rank	Overall Rank (without age)	Overall Rank (with age)

Technical Approach

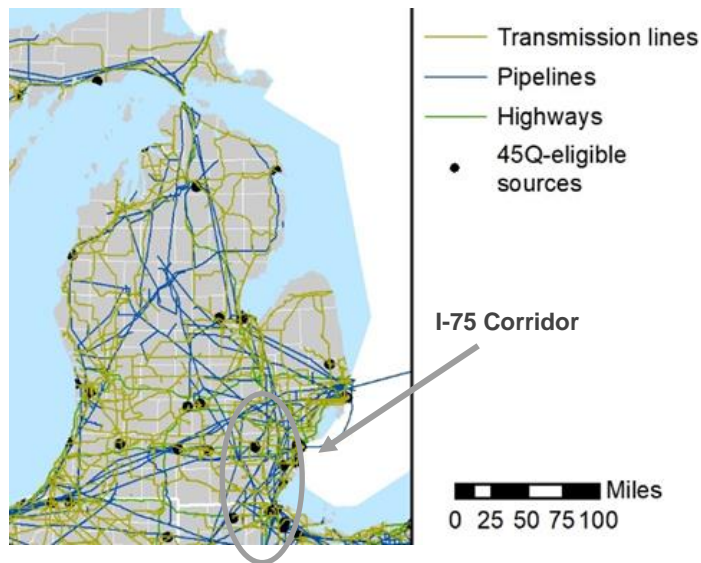

Schedule/Milestones/Success Criteria

- 2-year project (October 2023-September 2025)
- Key success criteria: drill test well, identify site for hub, community/stakeholder engagement, verify design & techno-economics.

Task/ Subtask	Milestone & Description	Planned Completion Date	Verification Method
3.0	Well drilled and planned characterization activities complete	16 Months after project start	Well Completion Report
4.0	Static Earth Model and Dynamic Model completed	18 Months after project start	Geologic Modeling and Plume Extent Report
2.0/8.0	Techno-Economic Assessment and Jobs and Economic Revitalization Assessment show a viable, economically attractive project with benefits to affected communities	18 Months after project start	Techno Economic Assessment and Public Engagement Plan
7.0	Additional Characterization and Class VI permitting plans completed	30 Days before end of project	Additional Characterization and Permitting Plan
2.0	Community characterization to understand demographics, challenges, and history to guide outreach plan	12 Months after project start	Community characterization report
2.0/9.0	Public engagement/Community Benefits Plan to guide communications and engagement with communities, DEIAs, DACs, and EJ areas	Update 90 days after project start Final 30 days before project end	Community dynamics, benefits, and outreach report

Plans for Future Commercialization

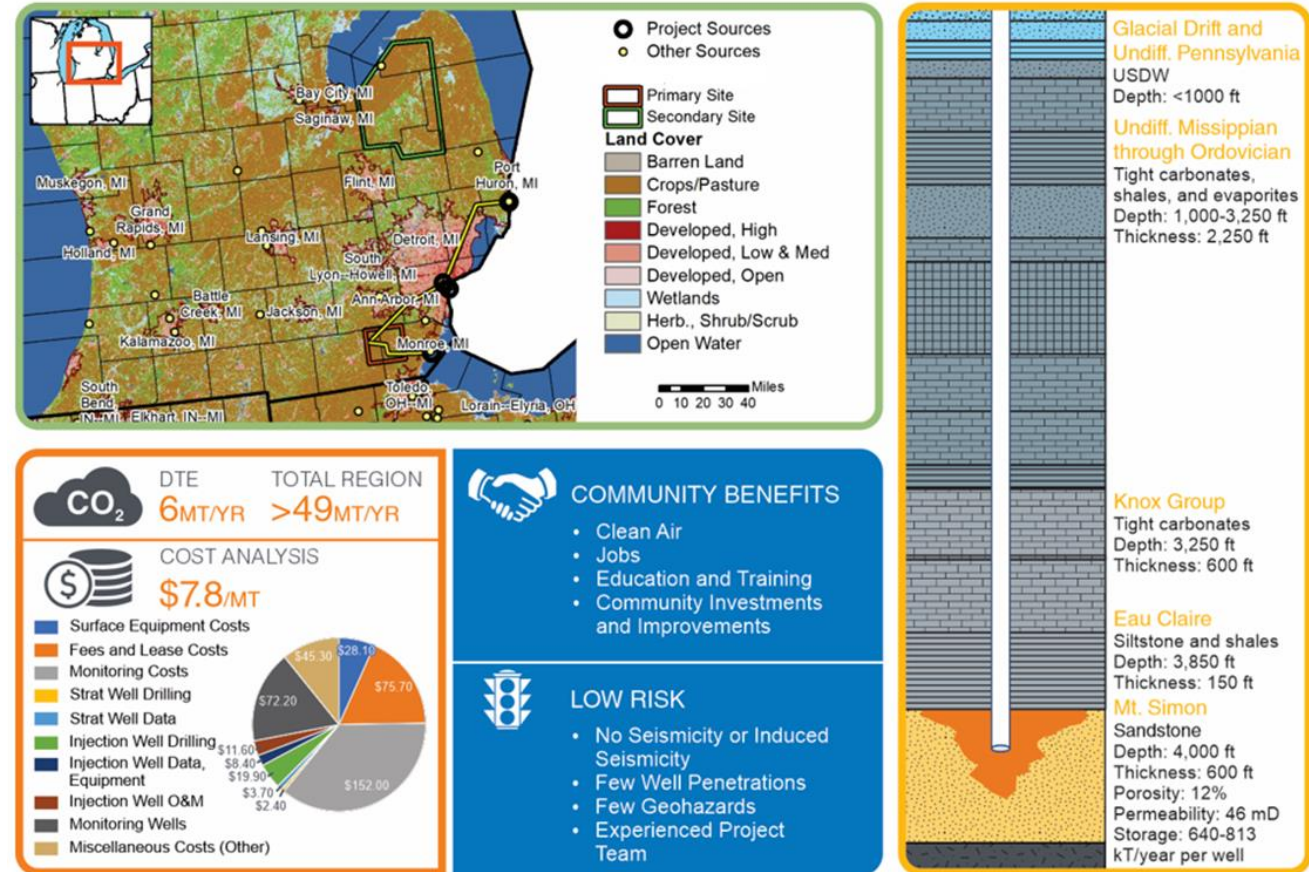

- **Future plans:** include linking sources and sinks for a variety of CO₂ sources in southern Michigan and northern Ohio (DTE Energy, Marathon, and other industrial emitters along the I-75 corridor).
- DTE is investing in upgrading its power generation portfolio and corresponding distribution grid to reduce outages.
- Implementing the SE MI CarbonSAFE project enables a reliable power supply through dispatchable resources that can accelerate decarbonization, helping mitigate climate change/resilience risks.

<p>Storage certainty remains a key need in Michigan. Previous work has shown the potential for saline storage projects in the state; however, storage projects have not been researched to support commercial-scale implementation.</p> <p>Path Forward: Support for integrated, targeted commercial-scale projects is needed to provide storage certainty.</p>	5 of 6
<p>Infrastructure must be developed to transport CO₂. CO₂ pipelines will likely be needed to transport CO₂ from Michigan sinks to storage areas. In addition, storage hubs will require the drilling of injection and monitoring wells.</p> <p>Path Forward: Michigan's existing pipeline, oil and gas, and brine disposal businesses provide a significant resource for CCUS project development.</p>	3.5 of 6
<p>State-level funding, incentives, and policies are needed to attract interest to Michigan. MRCI has been receiving interest in CCUS from several industrial sources in Michigan, including electric power companies and chemical plants.</p> <p>Path Forward: State-level incentives could propel these companies to implement CCUS in Michigan. State policy must be developed to provide project certainty.</p>	2 of 6
<p>Public outreach, a crucial part of any project, must be completed for specific project sites. These efforts should focus on the benefits of projects while addressing the risks and project safeguards.</p> <p>Path Forward: Public outreach can be accomplished through meetings, factsheets, and public meetings with stakeholders.</p>	6 of 6

Summary

- Technical approach is designed to ensure a **safe**, long-term, economic, and publicly accepted commercial 63 Mt CO₂ storage complex in SE Michigan
- Progress to date:
 - Processing & interpretation of 290 miles of 2D seismic
 - Regional geological characterization
 - CO₂ storage hub design, risk analysis
 - Outreach & Community Benefits Plan refinement and specification
 - Finalizing stratigraphic test well location

Reducing Risk, Advancing Technology, and Supporting Growth

Safe and secure CO₂ storage system is required with storage capacity, sufficient confining layers, monitoring, and safety protocols to ensure public acceptability.
