The Illinois Basin Carbon Ore, Rare Earth, and Critical Minerals Initiative

DE-FE0023049

Jared T. Freiburg, PhD

Freiburg@Illinois.edu

Illinois State Geological Survey

University of Illinois at Urbana-Champaign

U.S. Department of Energy National Energy Technology Laboratory Resource Sustainability Project Review Meeting April 2 - 4, 2024

Project Overview

- Funding Source
 - DOE: \$1,999,942.00
 - Cost Share: \$497,478.00
- Project Dates
 - Start: September 21, 2021
 - Finish: May 31, 2024

Project Objective: Evaluate the domestic occurrence of strategic elements in coal, coal-based resources, and waste streams from coal use.

I ILLINOIS

Illinois State Geological Survey

Prairie Research Institute

NIVERSITY OF ILLINOIS URBANA-CHAMPAIGN

Project Scope

- Environmental Justice, Jobs Creation, and Product Safety
 Task 1
- Basin-wide assessment of CORE-CM (*supplemental analysis)
 - Task 2 Geology; Task 3 Waste Streams
- Infrastructure, business, and industry evaluation
 - Task 4
- Mining and separation technologies and high-value carbon product development
 - Task 5
- Technology Innovation Center, Stakeholder Engagement, Outreach
 - Task 6 TIC; Task 7 Stakeholder

Figure 2. Stratigraphic chart of the Pennsylvanian System in the Illinois Basin, showing major coal members (modified from Greb et al.,1992, Mastalerz and Harper,1998, Mastalerz et al., 2018). Abbreviation: Fm., Formation; Gp., Group.

In the Illinois Basin, the **Pennsylvanian System is divided into the Raccoon Creek, Group the Carbondale Group or Formation, and the McLeansboro Group.** Formation and group nomenclature is the same in Illinois and western Kentucky (Jacobson et al., 1985; Tri-state committee, 2002). In Indiana, (1) the Raccoon Creek Group includes the Mansfield (oldest), Brazil, and Staunton (youngest) formations and the Caseyville Formation is not recognized, (2) the Carbondale Formation is a Group rather than a Formation, and the Carbondale Group in Indiana includes the Linton (oldest), and Dugger (youngest) formations, (3) the base of the Linton Formation of the Carbondale Group is defined at the base of the Seelyville Coal that is partly equivalent to Davis Coal in Illinois and western Kentucky, and (4) the top of the Dugger Formation of the Carbondale Group is defined at the top of the Danville Coal, which is younger than the top of the Carbondale Formation in Illinois and western Kentucky (Tri-state Committee, 2002).

The Carbondale Formation or Group covers about 90% of the area in which Pennsylvanian strata are exposed at the surface in the basin. It includes the most extensively mined coals in the basin. These coals are the Herrin and Springfield in descending stratigraphic order. The Carbondale coals are commonly widespread and vary in thickness from a few inches to more than 6 feet in many areas in which the coals have been mined.

ILLINOIS Illinois State Geological Survey PRAIRIE RESEARCH INSTITUTE

Illinois Basin Coal Mine

Operating Illinois Basin coal mines have produced a total of 68 million short tons annually (U.S. Energy Information Administration). **Annual coal production in individual mines ranges from 2,000 short tons to 9 million short tons**. The largest producing mines currently mining coal in the basin are (1) 9.4 million short tons per year for the River View Coal LLC. Mine in Union County, western Kentucky, (2) 6.4 million short tons per year for the Lively Grove Mine, Prairie State Generating Company LLC., in St. Clair County, Illinois, and (3) 5.2 million short tons per year for the Bear Run Mine, Peabody Energy LLC., in Sullivan County, Indiana (U.S. Energy Information Administration, 2022). **More than \$4.2 billion is the annual economic impact of Illinois Basin coal production and generation**.

^Map showing the active coal mines and coal preparation plants in the Illinois basin.

Project Outcomes (highlights)

- Development of a comprehensive database with a user-friendly dashboard
- Data encompasses coal (+waste) samples collected and analyzed across the Illinois basin
- Basin Model developed for REE in-place (coal) and associated with waste
- Comprehensive waste re-use plan developed (led to a FEED-study award)
- Robust Stakeholder Relationships

Historical and Active Coal Mines and Data

More than **12,000 data points** of Coal Quality and elemental geochemistry have been collected for IB CORECM.

In Illinois, 6,700 existing data have been assembled by the Illinois State Geological Survey from the Illinois Coal Quality Database, USGS Data Series 1135 (Kolker et al., 2018), Earth-MRI dataset, and scientific publications (Lefticariu et al., 2020; Kolker et al., 2021).

In Indiana, 3,300 data have been collected by the Indiana Geological Survey from Indiana Coal Quality Database, National Coal Resource Dataset, EC dataset, and Earth MRI dataset.

In western Kentucky, 3,200 coal information and assessing coal resources have been performed by the Kentucky Geological Survey from the USGS reports, National Coal Resource Data System Coop, Coal Availability and Recoverability, National Coal Quality Inventory, and National Coal Resource Assessment.

Illinois Basin

[^]Map showing the location of historical and active coal mines and coal preparation plants in the Illinois basin.

Critical Minerals and Rare Earth Elements

REE data based on :

- 363 whole-rock basis raw coal samples
- 116 full channel raw coal samples of all whole-rock basis samples
- 273 ash-basis raw and clean coal samples
- Coal waste data from Kolker et al. (2021), Lefticariu et al. (2020)

Illinois Basin

○ RE-CM

Data Acquisition

- 30 active coal sites on 51 coal mines and coal preparation plants were investigated for REE resource assessment
- sampling strategy focused on the stratigraphy, spatial distribution, analytical gaps, active production, and existing technologies
- new samples included core coal, seam floor and roof rocks, and partings of most extensively mined coals

Responsible

RESOURCE PART

Knight Hawk

Generating Company

Danville Coal (IL no.7, IN no.7)/Baker Coal (WKY no.13)

The Danville Coal is part of the Shelburn Formation in Illinois, and the Dugger Formation of the Carbondale Group in Indiana. The coal has been extensively mined in east central Illinois and in the western and southwestern Indiana. In much of the basin, the Danville Coal is thin, generally from a few inches to less than 3.5 feet thick, however, in Indiana, the coal is as much as 6.5 feet thick (Hatch and Affolter, 2002). The Danville Coal in southern Indiana is stratigraphically correlated with an upper bench of the Baker Coal of the Shelburn Formation in western Kentucky (Hatch and Affolter, 2002). The Baker coal is thin across much of western Kentucky but is locally as much as 7 feet thick (Greb et al., 1992; Hatch and Affolter, 2002).

Estimated Remaining Coal Reserves: 40.5 billion short tons (Smith and Brant, 1980; Damberger, 2000).

Rare Earth Element (average)

[^]Map showing the extent of the Danville Coal/Baker Coal and location of REE data in the Illinois basin.

Danville Seam Floor and Roof

The **floor rock of the Danville/Baker coals** consists of underclay or seat earth (rooted mainly of shale, siltstone, or sandstone). The Baker is commonly overlain by gray shale or sandstone. The **roof rock of the Danville Coal** is generally 1-2 feet thick, gray dark fissile shale with very impure limestone, and, locally, gray silty mudstone, or sandstone. Sandstones are part of paleochannels.

94.2 22.0 288.0 Lafavette

Ind

Jamestown Coal (IL), Hymera Coal (IN no.VI) and Paradise Coal (WKY no.12)

The Jamestown Coal in Illinois, the Hymera Coal in Indiana, and the Paradise Coal in western Kentucky are stratigraphically equivalent (Greb et al., 1992). In Illinois and western Kentucky, the Jamestown and Paradise coals are placed in the Shelburn Formation of the McLeansboro Group. In Indiana, the Hymera Coal is within the Dugger Formation of the Carbondale Group. The Jamestown-Hymera-Paradise coals are commonly 20 to 50 feet below the Danville Coal and 1 to 10 feet above the Herrin Coal. The Jamestown Coal is a thin, widespread coal in southern Illinois, which has never been mined. In Indiana, the Hymera Coal is thicker (as much as 11 feet) and has been extensively mined (Spencer, 1953). The Paradise Coal of western Kentucky is locally thick (as much as 7 feet) and was surface mined along with the underlying Herrin Coal along the southern margin of the basin (Greb et al., 1992)

Estimated Remaining Coal Reserves: 15.7 billion short tons (Spencer, 1953; Smith and Brant, 1980; Damberger, 2000).

Rare Earth Element (average)

Map showing the extent of the Jamestown Coal/Hymera Coal and location of REE data in the Illinois basin.

Herrin Coal (IL no.6, WKY no.11)

The **Herrin Coal** is widespread in Illinois and parts of western Kentucky, but not well developed in Indiana. In Indiana, the Herrin Coal has been considered to be a lower bench of the Hymera Coal (Treworgy et al., 1999). The coal is a normal bright-banded coal where it occurs in the basin and commonly a claystone parting called the "Blue Band" in the lower part of the seam (Hopkins and Simon, 1975). In some places, the coal is cut out by the sandstone channels of the Anvil Rock Sandstone (Potter et al., 1961; Nelson, 1983; Greb et al., 2020). Most of the **Herrin Coal** in Illinois is 6 feet thick over extensive areas and locally reaches 15 feet thick just south of Springfield, Illinois. In east-central and extreme northern Illinois Basin, the coal is thin or absent. The coal is also absent across a broad band in western Kentucky but thickens to as much as 10 feet thick along the southern edge of the basin (Weisenfluh, 2011).

Estimated Remaining Coal Reserves: 82 billion short tons (Korose and Elrick, 2010; Weisenfluh, 2011).

Rare Earth Element (average)

[^]Map showing the extent of the Herrin Coal and location of REE data in the Illinois basin.

Herrin Seam Floor and Roof

The floor rock of the Herrin Coal is a gray fissile shale seat earth or a green claystone. Underclays are locally thick beneath the coal. The roof rock varies from silty gray shale to black fissile shale of the Anna Shale, to limestone of the Providence (Brereton) Limestone.

[^]Map showing the extent of the Herrin Coal and location of REE data in the Illinois basin.

Springfield Coal (IL no.5, IN no.V, WKY no.9)

In Illinois and western Kentucky, the **Springfield Coal** is included in the Carbondale Formation, but the Coal in Indiana is within the Petersburg Formation of the Carbondale Group. The coal underlies about two-thirds of Illinois as well as portions of west central Indiana and western Kentucky. The Springfield Coal has actively been mined in the basin for more than 100 years. Its thickness is usually between 4.5 and 6 feet. However, the coal has variable thickness along paleochannels. In Indiana, the coal locally reaches 13 feet thick along the Galatia paleochannel. The coal is also cutout by paleochannels in parts of Illinois and Indiana (Hopkins, 1968; Bear and Williamson, 1979; Eggert, 1982, 1984; Greb et al., 2020; Nelson et al., 2020). The coal is thin or absent in the southwestern and extreme northern portions of the basin.

Estimated Remaining Coal Reserves: 82 billion short tons (Hatch and Affolter, 2002; Korose and Elrick, 2010; Weiselfluh, 2010).

[^]Map showing the extent of the Springfield Coal and location of REE data in the Illinois basin.

Springfield Seam Floor and Roof

The Springfield Coal is normally overlain by a 6 to 24 inches of black, fissile shale, termed the Turner Mine Shale Member, but in some places extending from Saline County (IL) to Gibson County (IN), a silty gray shale or sandstone, i.e., the Galatia paleochannel system, directly overlies the coal. The coal is locally split and cutout along the Galatia paleochannel in Illinois and cutout by the Henderson paleochannel in Kentucky (Hatch and Affolter, 2012). Floor rocks generally consist of a seat-earth or underclay. Underclay's are locally thick beneath the Springfield Coal.

Carbondale Fm/Gp and Tradewater Fm Coals

Many coals occur in Pennsylvanian strata beneath the lower part of the Carbondale Formation (Illinois and western Kentucky) or Group (Indiana) that includes the **Survant, Colchester, and Davis-Dekoven-Seelyville coals**. Coals of the Tradewater (Illinois and western Kentucky) and Brazil (Indiana) Formations are generally less extensive and have fewer resources than the coal beds in the overlying Carbondale Formation/Group. Most economically coal seams are the **Murphysboro, Rock Island, Buffaloville, Upper and Lower Block Coals**.

REE and Critical Minerals (average)

Coal and location of REE data in the Illinois basin.

[^]Map showing the extent of the Pennsylvanian Coal ai location of REE data in the Illinois basin.

Gap Analysis

- Illinois Basin has 51 active coal mines and coal preparation plants, and numerous associated gobs and slurry ponds, 67 abandoned or inactive AMD sites, and 186 identified coal ash impoundments.
- Largest spatial distribution of existing data in SE Illinois
- IB CORE-CM sampling focused on a systematic collection of detailed raw coal, clean coal, partings, seam floor and roof rocks, fine (slurry) and coarse refuse coals.

> Map showing the extent of the Pennsylvanian Coal location of active Coal mines and Coal preparation plants in the Illinois basin, and extent of data.

Rock Island no.1 roof rock av. TREE 549.8 ppm (whole rock)

- The highest TREE (whole-rock) roof rocks with values more than 400 ppm.
- The highest TREE concentrations (ashbasis) Lower and Upper Blocks, Staunton, and Brazil Formation Coal in Indiana with values between 435.4 and 1,302.9 ppm.

Recommendations

- Understand why the high TREE concentrations are located on the **Basin Margin**
- Influence of the detrital materials • (margin, Galatia Channel, etc.) Study the possible influence of hydrothermal alteration from tectonic structures (anticlines, synclines, faults, Hicks Dome).
- Understand the connection between • type of deposition and REE contents.

Supplemental Characterization Funding

^Map showing the locations of IB CORE-CM drilling

- 6-month extension to further implement a sampling and characterization program
- Drilling campaign in old and inactive coal mine sites. Sites selection based on volume of coal waste, coal seams, and production age
- Core samples will be analyzed for geochemistry, carbon, and mineralogy to update and build models on coal waste resources and potential economic viability

Illinois Basin

Galatia North Mine

Probabilistic Resource Model Total REE Originally In-Place

- Includes most prospective basin-wide and regional coal seams, mine waste piles, & identified conventional deposits
- Total of ≈240 million elemental short tons

Models prepared by C. Bopp, Illinois State Geological Survey

Total REE in Available Resources

- Includes all sources originally in-place assessment
 - Cohn and Survant coal were not evaluated for available resources in legacy studies
 - Mine waste piles and conventional resources available by surface mining are considered "available"
- TREE in available sources: ≈31 million elemental short tons

TREE Distribution Trends in the Illinois Basin Coal Field

- Most coals show relative depletion of TREE in the coal itself vs. floor & ceiling
- Colchester coal (lower Pennsylvanian) is a notable exception:
 - Generally higher TREE compared to other coal seams
 - Near parity between TREE in coal vs. floor & ceiling
- Causes of this difference is an area of active investigation

IB-CORE-CM Coal Waste Reuse Plan

Illinois Rare Earth Novel Extraction & Supply (IRENES)

DE-FE0032489 IRENES FEED to deploy proven, innovative, and novel technologies to build a vertically integrated, modular REE and CM supply chain in the state of Illinois that will minimize waste and emissions while maximizing coproduction of useful materials.

and Supply

Plant A is an extraction facility, and Plant B is a refining facility. Plant A will be resource-site or resource-proximal facilities that produce MREO for further processing while "Plant B" will be facilities with final refining capability to transform MREO into HP REO or HP REM.

Illinois Rare Earth Novel Extraction and Supply

High Value Carbon Products from Illinois Coal

Source: NETL S&T Accomplishments 2020

- Illinois Basin Coals, even when high in ash, demonstrated conversion to liquids and mesophase formation. Mesophase pitch is a nematic liquid crystal, meaning it is a liquid with structure.
- Mesophase pitch can be spun into high performance carbon fiber, a material with applications in the aerospace industry as well as of interest for electric vehicle manufacturing.
- Mesophase formation also suggests that the samples may be converted to graphite, a high value carbon product used in lithium-ion batteries.

Above: Polarized light microscopy showing the anisotropic texture of mesophase pitch generated from liquefied Illinois Basin coal.

Construction Products from Coal Waste

- Coal mine tailings include a high % of reactive aluminosilicates which are a viable candidate for metakaolin replacement
- Treated coal waste can substitute more than 40 wt.% of metakaolin while sacrificing less than 10% off the compressive strength
- Coal waste geopolymers could be utilized to produce pavements and substitution for many conventional materials

CORE-CM Regional Technology Innovation Center

Three Main Functions:

- Connecting Industrial and Commercial Partners with Researchers from Participating States and Institutions
- Connecting Industrial and Commercial Partners with Available Physical Facilities (labs and pilot facilities in CM space)
- Issuing Small Research Grants to Address Key Questions and Problems Arising from Unconventional CM Production and Product Development in the Region

CORE-CM Regional Technology Innovation Center

Survey on CORE-CM Research Capabilities & Resources at UIUC, UK and SIU

A breadth of R&D expertise at 3 campuses, including REE-CM separation, end uses, characterization, mining, carbon materials, etc.

Existing R&D capabilities for characterizing and producing REE-CM and carbons (i.e composition/ surface/ microstructure characterization and lab test systems)

Areas of research interest for proposed TIC:

- Innovative/sustainable mining technologies
- New characterization techniques
- Next-generation technologies for REE-CM separation & purification (e.g., highselectivity materials and approaches)
- New or alternative REE-CM end products (i.e., batteries, electrochemical catalysts).
- High-value, non-BTU carbon materials (graphite, graphene, fibers, etc.)

Expertise of CORE-CM research from a recent survey

Areas of interests for CORE-CM research & development

Summary

- IB-CORE-Cm Completed Initial Characterization Assessment and Developed a Broad Resource Model
- Identification of enriched strata with "economic" potential
- Several Business Partnership Opportunities have been Identified and in early stages of development
- A comprehensive waste reuse plan has been put forwarded (IRENES)
- The Illinois Basin Technology Innovation, Research, and Education Center
- Outreach, partnership, and collaboration!

The Illinois Basin provides major opportunities to develop new CORE-CMindustries utilizing coal waste47

Illinois State Geological Survey prairie research institute

Thank You!

Appendix

Plots showing the rare earth elements in the major coal seams, roof and floor rocks, and refuse coals in Illinois and Indiana.

Raw Coal

- All coal samples have concentration values slightly enriched than UCC.
- Sm and Tm show systematically an enrichment in concentration values than UCC, while Dy and Ho are slightly depleted in the Springfield no.V and unnamed Staunton Coals in Indiana.
- Most of LREEs have concentration values less than 50 ppm, and a few ppm in HREEs.
- All coal samples generally have total REE concentration values below 300 ppm.
- Murphysboro Coal from the Creek Paum Mine in Illinois and the unnamed Staunton Coal from the Antioch and Shamrock mines in Indiana show total
 REE concentration values of 599.4 ppm, 1,205.7 ppm, and 1302.9 ppm respectively.
- Brazil Formation Coal from the Shamrock Mine contains a total REE concentration of 703.1 ppm.
- Cohn and Friendsville Coals from the Friendsville Mine in Illinois have a high total REE concentration values on ash basis of 598.8 and 409.3 ppm respectively.
- These coals have individual elements that have particularly high LREE concentration values. These elements include La that is slightly above 100 ppm, Ce that varies between 250 and 350 ppm, and Nd that is up to 100 ppm.

- Concentration values for the floor rocks are slightly enriched than UCC for the Cohn, Danville no.7, Colchester no.2, Dekoven, and Murphysboro Coals in Illinois, and the Danville no.VII, Hymera no.VI, Springfield no.V, unnamed Staunton in Indiana.
- The Herrin no.6 and Springfield no.5 coals in Illinois are slightly depleted than UCC, while the same coal seams in Indiana are slightly enriched than UCC.
 - Most floor rocks show a depletion in Tb, Dy, and locally in Er and Ho. Samarium and Gadolinium are enriched for the Danville no.VII, Hymera no.VI, Springfield no.V, and unnamed Staunton coals.
 - The Colchester no.2 coal in Illinois has the highest LREE/UCC concentration values.

Floor

Roof Rock

- The highest REE concentration values are encountered in the roof rocks overlying the Cohn, Friendsville, and Rock Island no.1 Coals in Illinois, and Hymera no.VI Coal in Indiana.
- The average total REE concentration values on whole rock are respectively 350.9 ppm (max: 2,258.7 ppm in Clarke County, Illinois) for the Cohn Coal roof rocks, 424.4 ppm for the Friendsville roof rocks, 549.0 ppm for the Rock Island no.1 Coal roof rocks, and 412.9 ppm for the Hymera no.VI Coal roof rocks.
- The Cohn and Rock Island no.1 Coals roof rocks show an enrichment in LREE and a depletion in HREE, while the Hymera no.VI Coal roof rock shows a flat pattern with an enrichment in middle REE (MREE; Sm, Eu, and Gd).
- The roof rocks overlying the Herrin no.6 and Springfield no.V Coals contain a slight MREE enrichment.
- In Clark County, Illinois, a roof rock sample overlying the Cohn Coal contains REE concentration values: 588 ppm in La, 1,110.0 ppm in Ce, and 37 ppm in Nd.

REE concentrations in the refuse materials are only slightly enriched above UCC and are much below the REE patterns in coal seams.

Coal Waste

- The REE patterns show mainly a slight enrichment in LREE and a depletion in LREE.
- The MREE concentration values show a few enrichments in Sm and Gd.
- Tb is enriched in the refuses from Springfield no.V and unnamed Staunton coals in Illinois, and is depleted in all refuses from the Illinois Basin coal seams.

Coal tailings as the source of critical minerals – Ga and Ge

Organic fraction of coal tailings is a promising source of Ge, as suggested by a negative correlation of Ge with ash yield.

#	Task Name	Start	End	~~	~·	×-	~-	~*	×.	×-	~-	~**	SI	IIS	5 9	Z X	ÐI	Ĕ č	5 IS
1.0	Project Management and Planning											F							
1.1	Summary of Environmental Justice Considerations	09/21/2021	09/21/2023		Α							B	X						
1.2	Summary of Economic Revitalization and Job Creation Outcomes	09/21/2021	09/21/2023		С							D,E	Χ						
1.3	Environmental, Safety, and Health (ES&H) Analysis for Products Proposed to be Manufactured From CORE-CM Resources	09/21/2021	09/21/2023										Х						
2.0	Basinal CORE-CM Resources Assessment										G, J								
2.1	Collect, assemble, and evaluate existing data	09/21/2021	6/21/2023										Х	Х	2	K X	х	Х	
2.2	Develop analytical geologic resource models and maps	03/21/2022	6/21/2023										Х	Х	2	X X			
2.3	Gap analysis	03/21/2022	6/21/2023					Н					Х	Х	2	X X			
2.4	Characterization and Data Acquisition Plan	03/21/2022	6/21/2023					Ι					Х	Х	2	X X	X	X	x
3.0	Basinal Strategies for Reuse of Waste Streams										J,K								
3.1	Review existing data and identify gaps	09/21/2021	6/21/2023											Х	2	X X	Х	Х	
3.2	Waste Stream assessment for CORE-CM	03/21/2022	6/21/2023											Х	2	X X	X	Х	
3.3	Research and Development (R&D) plans for project development	03/21/2022	6/21/2023											Х	2	X X			
4.0	Basinal Strategies for Infrastructure, Industries and Businesses										L								
4.1	Identify CORE-CM infrastructure, industries, and businesses	09/21/2021	6/21/2023																X
4.2	Regional infrastructure needs	03/21/2022	6/21/2023											2	x				X
4.3	Economic Challenges	03/21/2022	6/21/2023															7	X X
4.4	Supply Chain Gaps	03/21/2022	6/21/2023								М								X
5.0	Technology Assessment, Development and Field Testing		•								Ν								
5.1	Conventional and innovative mining techniques	09/21/2021	6/21/2023						0					2	x				X
5.2	Separation and purification of CORE-CM	09/21/2021	6/21/2023							Р				2	x			-	
5.3	Incorporation of CORE-CM into products	09/21/2021	6/21/2023										Х	2	x			7	x
5.4	Strategies to fulfill gaps and field test technologies	03/21/2022	6/21/2023											2	x			7	x
6.0	Technology Innovation Center										0								
6.1	Technology Innovation Center Plan of Development	09/21/2021	6/21/2023										X	X	x				
6.2	Private-public partnerships	09/21/2021	6/21/2023										Х						
6.3	Education and training opportunities	09/21/2021	6/21/2023										Х	X X	x				
7.0	7.0 Stakeholder Outreach and Education																		
7.1	Conduct Stakeholder Analysis	09/21/2021	6/21/2023										X						
7.2	Develop Stakeholder Engagement, Outreach, and Education Plan	03/21/2022	6/21/2023										X						
7.3	Develop Outreach Materials	03/21/2022	6/21/2023										X	XZ	X Y	κx			
7.4	Collaborations	03/21/2022	6/21/2023										X						

*No-cost extension to 5/31/2024

Milestones

			Milestone Log	g		
Task/ Subtask	Letter	Milestone Title	Planned Completion Date	Actual Completion Date	Percentage Completion	Status
1.0/1.1	А	Project Kickoff Meeting	10/21/21	10/07/21	100%	Completed 10/21
1.0/1.1	В	Site Access Agreement	03/20/24			
1.0/1.2	С	Revised Project Management Plan	10/21/21	10/13/21	100%	Submitted 10/13/
1.0/1.2	D	EDX FOA-2364 REE Researcher Database	03/20/24		75%	Submitted 1/2/24
1.0/1.2	Е	Input for NET REE-SED Sample data Needs	03/20/24		75%	
1.0	F	Phase 1 Final Report	03/20/24	02/22/24	100%	Submitted 02/22
2.0	G	Basinal Resource Assessment	09/30/23	09/08/23	100%	Submitted 09/08/
2.0/2.3	Η	Resource Assessment Gap Analysis	02/20/23	03/21/23	100%	Submitted 03/21/
2.0/2.4	I	Characterization and Data Acquisition Plan	02/20/23	03/21/23	100%	Submitted 03/21/
2.0/3.0	J	Resource Samples for Mineral Characterization and Analysis	09/30/23	09/25/23	100%	Submitted 09/25/
3.0	Κ	Initial Waste Stream Reuse Plan	<mark>02/16/24</mark>		90%	<mark>In prep</mark>
4.0	L	Results of Basinal Strategies for Infrastructure, Industries and Business Assessment	12/08/23	03/24/24	100%	Submitted 03/24/
4.0/4.4	М	Supply Chain Gap Analysis	12/08/23		99%	In review
5.0	N	Initial Technology Assessment and Field Development Plan	07/20/23	08/14/23	100%	Submitted 08/14/
5.0/5.1	0	Technology Gap Analysis	02/20/23	04/04/23	100%	Submitted 04/04/
5.0/5.2	Р	SIPOC Analysis	07/20/23	07/20/23	100%	Submitted
6.0	Q	Initial Technology Innovation Center Plan	01/22/24		99%	In review
7.0	R	Initial Stakeholder Outreach and Education Plan	07/20/23	07/28/23	100%	Submitted 07/28/
