

**Extending TOUGH+HYDRATE with a Parallel  
Particle Transport Simulator:  
Numerical Investigation of Sand Production Issues  
During Production from Hydrate Deposits**  
FWP-1022410

T. Huang<sup>1</sup>, G.J. Moridis<sup>1,2</sup>, T.A. Blasingame<sup>1</sup>

1: Texas A&M University, Department of Petroleum Engineering

U.S. Department of Energy  
National Energy Technology Laboratory  
Resource Sustainability Project Review Meeting  
April 2-4, 2024

# Presentation Outline

---

- Task Motivations and Objectives
- Parallel **T**ough + **H**ydrate + **P**article **T**ransport (**THPT**) Simulator
- Representative Accomplishments
- Task Challenges

# Task Motivation

## ❑ Abrupt termination of hydrate production trials

- Clogging of pore throats
- Blockage of the well head
- Equipment failures

Sand production, North Slope of Alaska  
(Schoderbek et al., 2013)

Sand production, Nankai Trough  
(Yamamoto et al., 2017)

# Task Motivation

## ❑ Few simulations based on Lagrangian Method

### Eulerian vs Lagrangian

Continuum approach

Geomechanics/Concentration

**Low** computational cost

Uchida et al (2016), Yan et al (2018), Loret et al (2019), Akaki et al (2020), Li et al (2024), ...

• Discrete element approach

• Geomechanics+Particle tracking

• **High** computational cost

• Kazidenov et al (2023)

# Task Objectives

---

- To develop a parallel Tough + Hydrate +Particle Transport (THPT) code capable of standalone application or seamless integration with TOUGH+HYDRATE
- To leverage the Lagrangian Discrete Element Method (DEM) to simulate the discrete characteristics inherent in sand production issues

# THPT: Simulation Approach - DEM

## DEM Governing Equations

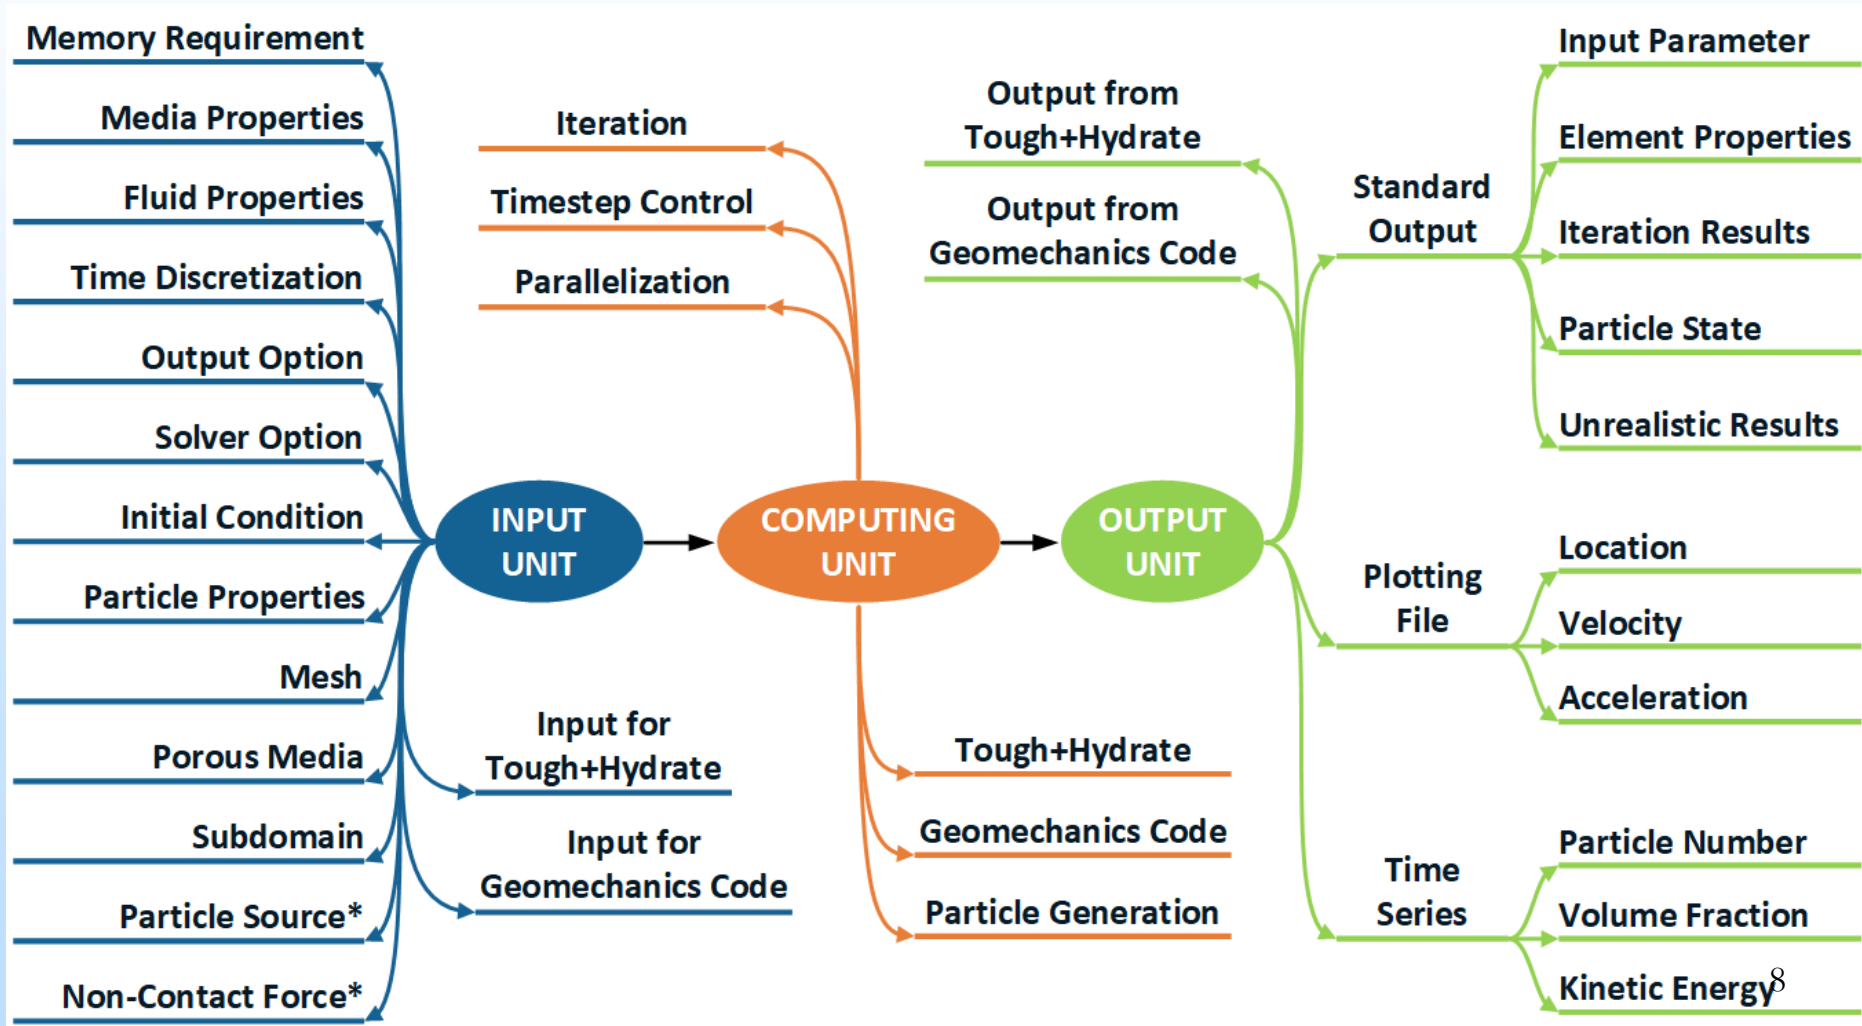

# THPT: Underlying Physical Models

Forces	Symbol	Equations
Elastic force	$f_{ij}^{cn}$	$-\frac{4}{3}E^*\sqrt{R^*}\delta_n^{\frac{3}{2}}\mathbf{n}$
Damping force	$f_{ij}^{dn}$	$-c_n\left(8m_{ij}E^*\sqrt{R^*}\delta_n\right)^{\frac{1}{2}}v_{n,ij}$
Van der Waals force	$f_{ij}^{wdl}$	$f_{vdw} = \frac{A_H}{24d}\left(\frac{1}{x^2}\right)\vec{n}_{ij}$
Electrical double layer force	$f_{ij}^{edl}$	$4\pi\epsilon(z\psi)^2R\exp(-\kappa d)$
Drag force(*)	$f_{f,i}$	$C_d\epsilon_f\frac{\pi(D_p)^2}{4}\frac{\rho_f(u-v)^2}{2}\epsilon_f^{-\chi}$
Gravity	$f_{g,i}$	$m_i g \left(1 - \frac{\rho_f}{\rho_p}\right)$
(*) $\chi = 3.7 - 0.65 \exp\left[-\frac{(1.5 - \log(Re))^2}{2}\right], C_d = \left(0.63 + \frac{4.8}{Re_p^{0.5}}\right)^2$		

# THPT: Architecture

## Fortran 95/03

# THPT: Coupling Scheme

$v_f$ : Water Flow Velocity

$X_f$ : Fluid Volume Fraction

$\varphi$ : Porosity

$k$ : Permeability

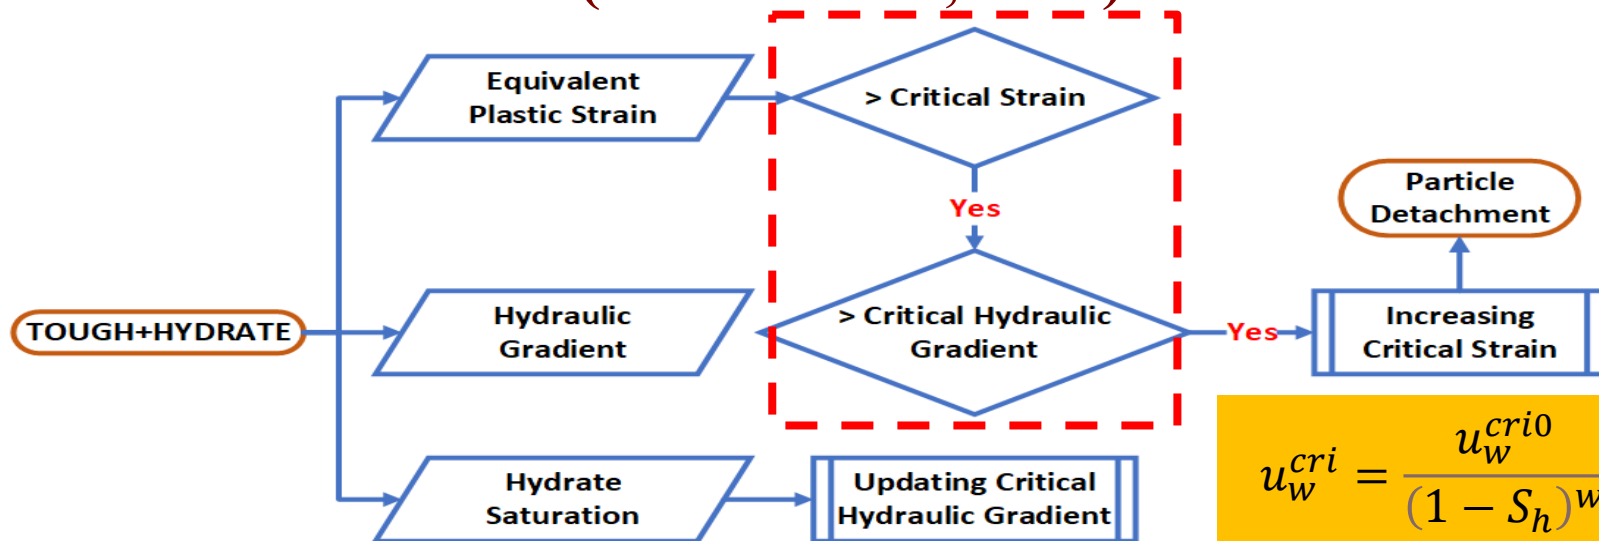

**Assuming that the presence of particles does not change the fluid properties**

# THPT: Particles Detachment

**Rock skeleton:** Cementation of sand grains and hydrate

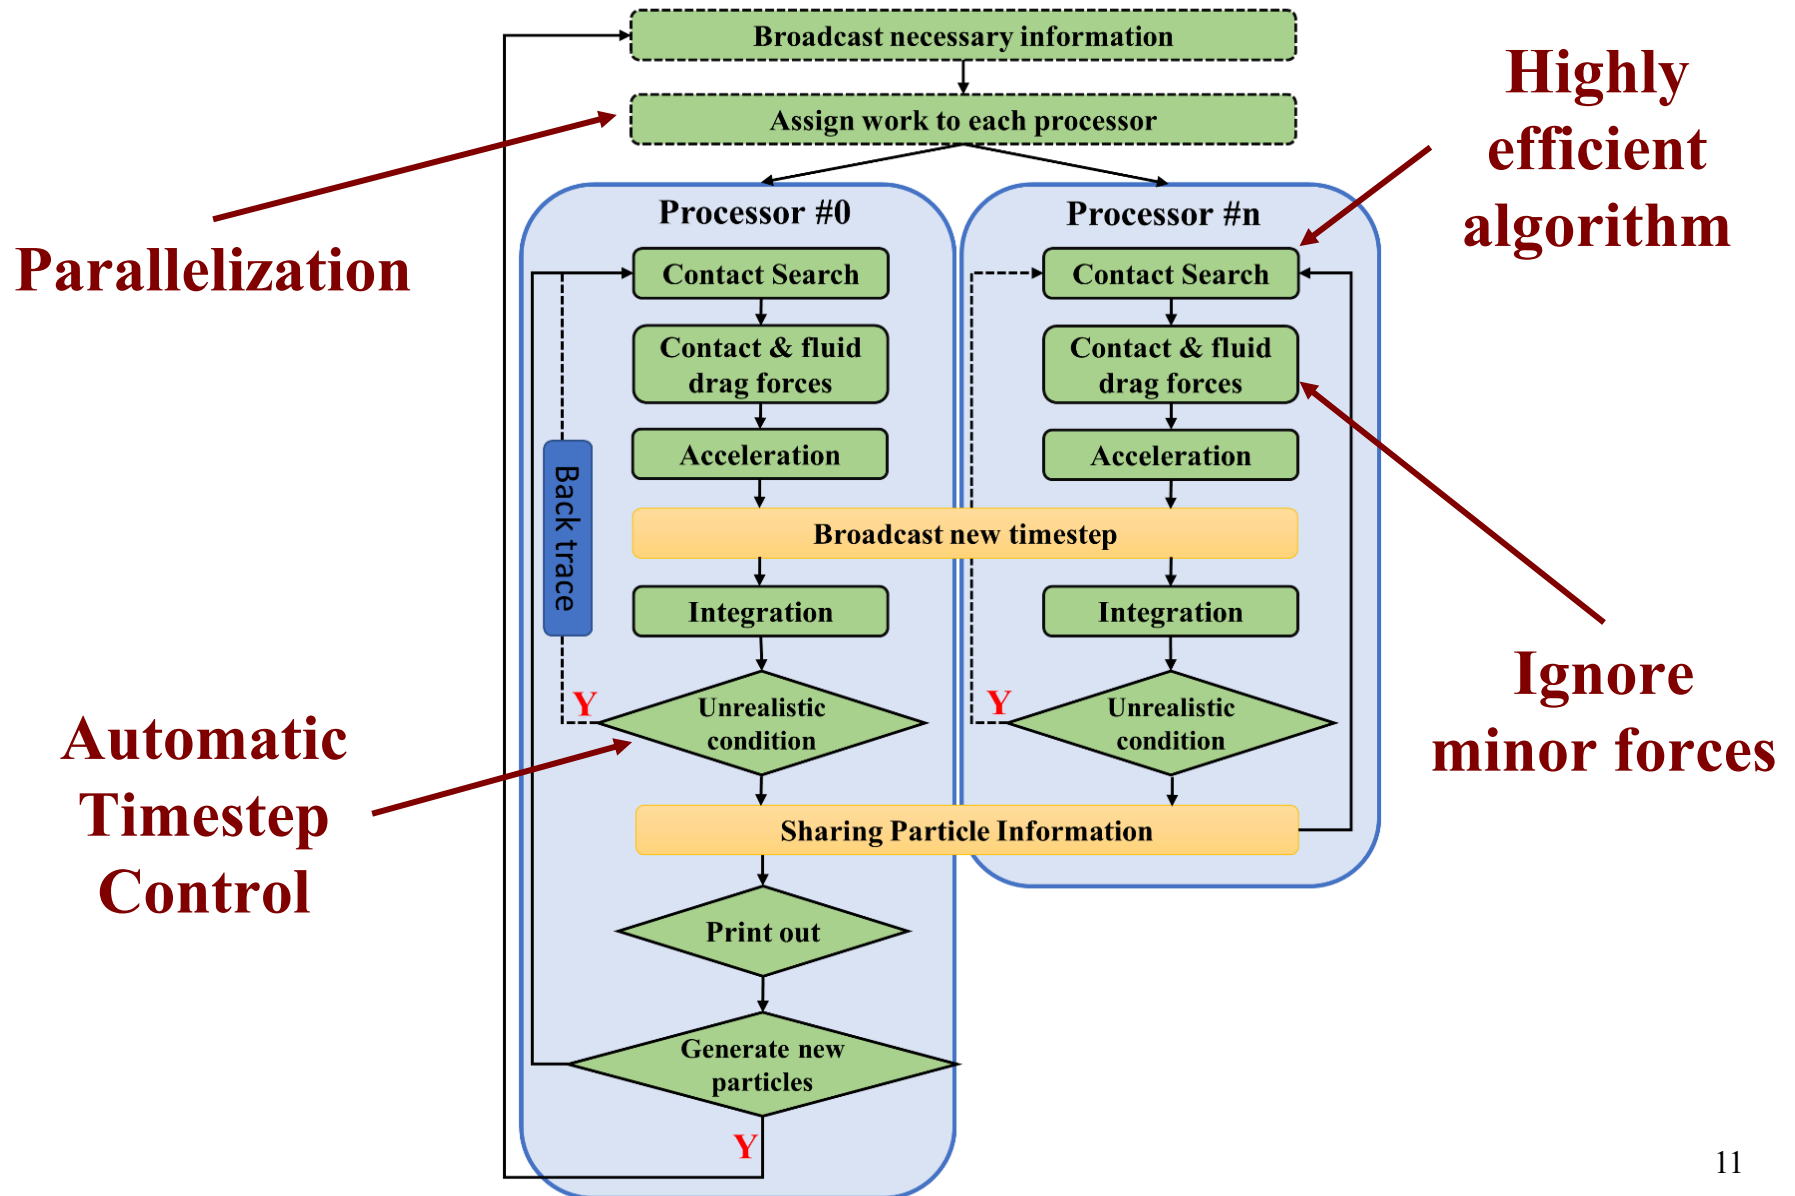

**Detachment Criterion (Uchida et al., 2016)**

$$u_w^{cri} = \frac{u_w^{cri0}}{(1 - S_h)^w}$$

# THPT: Improve Computing Efficiency

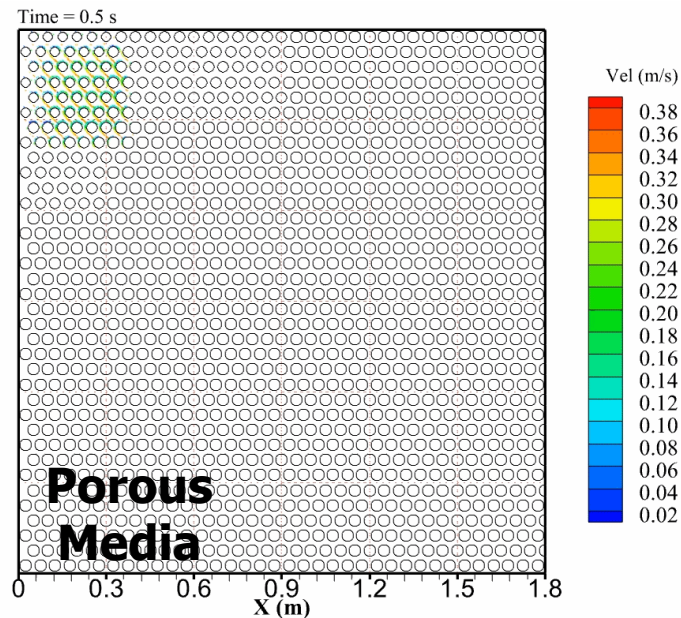

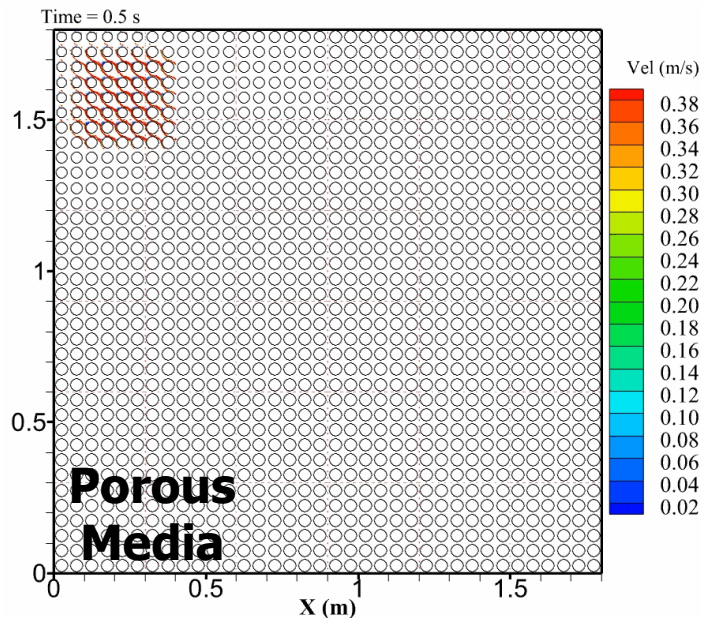

# THPT: Parallel Performance

## Balanced workload on each node

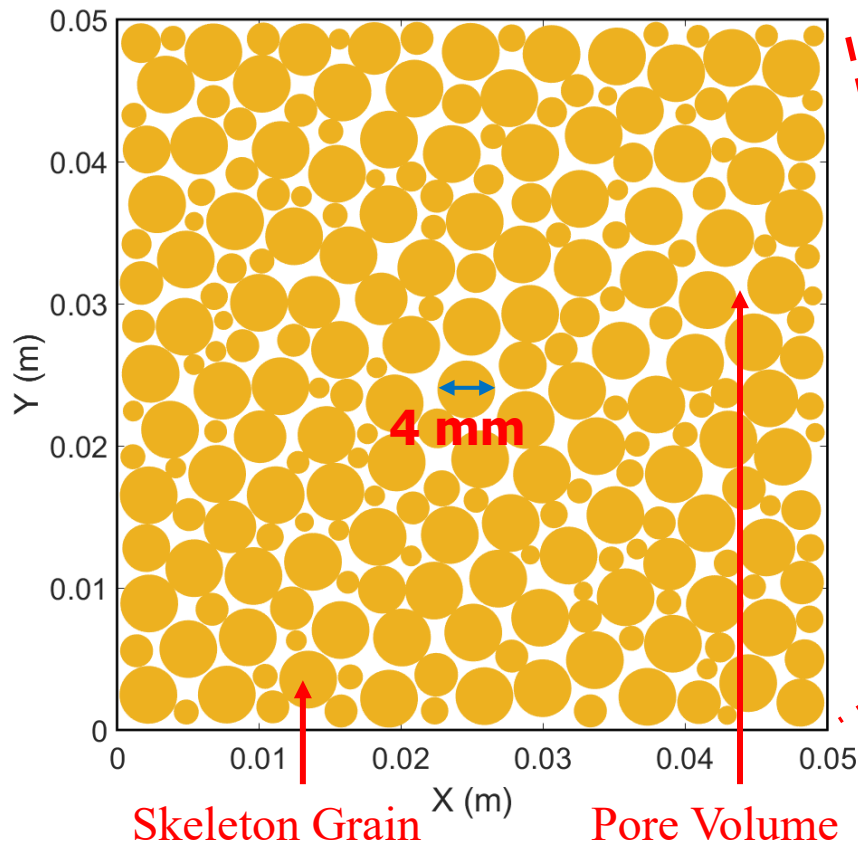

○ Rock  
● Sand

# Representative Accomplishments

## Porous Media in TPT

Skeleton grain number: **273**  
Maximum grain size: **4 mm**  
Minimum grain size: **0.6 mm**

## Mesh in TH

Simulation domain size: **10 m  $\times$  10 m**  
Element size: **0.05 m  $\times$  0.05 m**  
Element number: **40000**

# Modeling Settings

Parameter	Value	Parameter	Value
Rock density	2600 Kg/m <sup>3</sup>	Rock young modulus	1.0 MPa*
Initial porosity	0.3	Poisson ratio	0.3
Intrinsic Perm	2.96×10 <sup>-13</sup>	Damping coefficient	0.3
Hydrate density	920 kg/m <sup>3</sup>	<b>Sand particle radius</b>	<b>2.0×10<sup>-4</sup> m</b>
<b>Initial pressure</b>	<b>13 MPa</b>	W (criterion exponent)	3.0
Initial temperature	288 K	Max timestep	2.0×10 <sup>-3</sup> sec
<b>Initial hydrate saturation</b>	<b>0.5</b>	Coupling interval	3.0 sec
<b>Initial water saturation</b>	<b>0.5</b>		
Irreducible water saturation	0.12		
Entry capillary pressure	0.125 MPa		
Relative permeability model	$k_{rA} = \max \left\{ 0, \min \left\{ \left[ \frac{S_A - S_{irA}}{1 - S_{irA}} \right]^n, 1 \right\} \right\}$ $k_{rG} = \max \left\{ 0, \min \left\{ \left[ \frac{S_G - S_{irG}}{1 - S_{irA}} \right]^n, 1 \right\} \right\}$		
Capillary pressure			

  

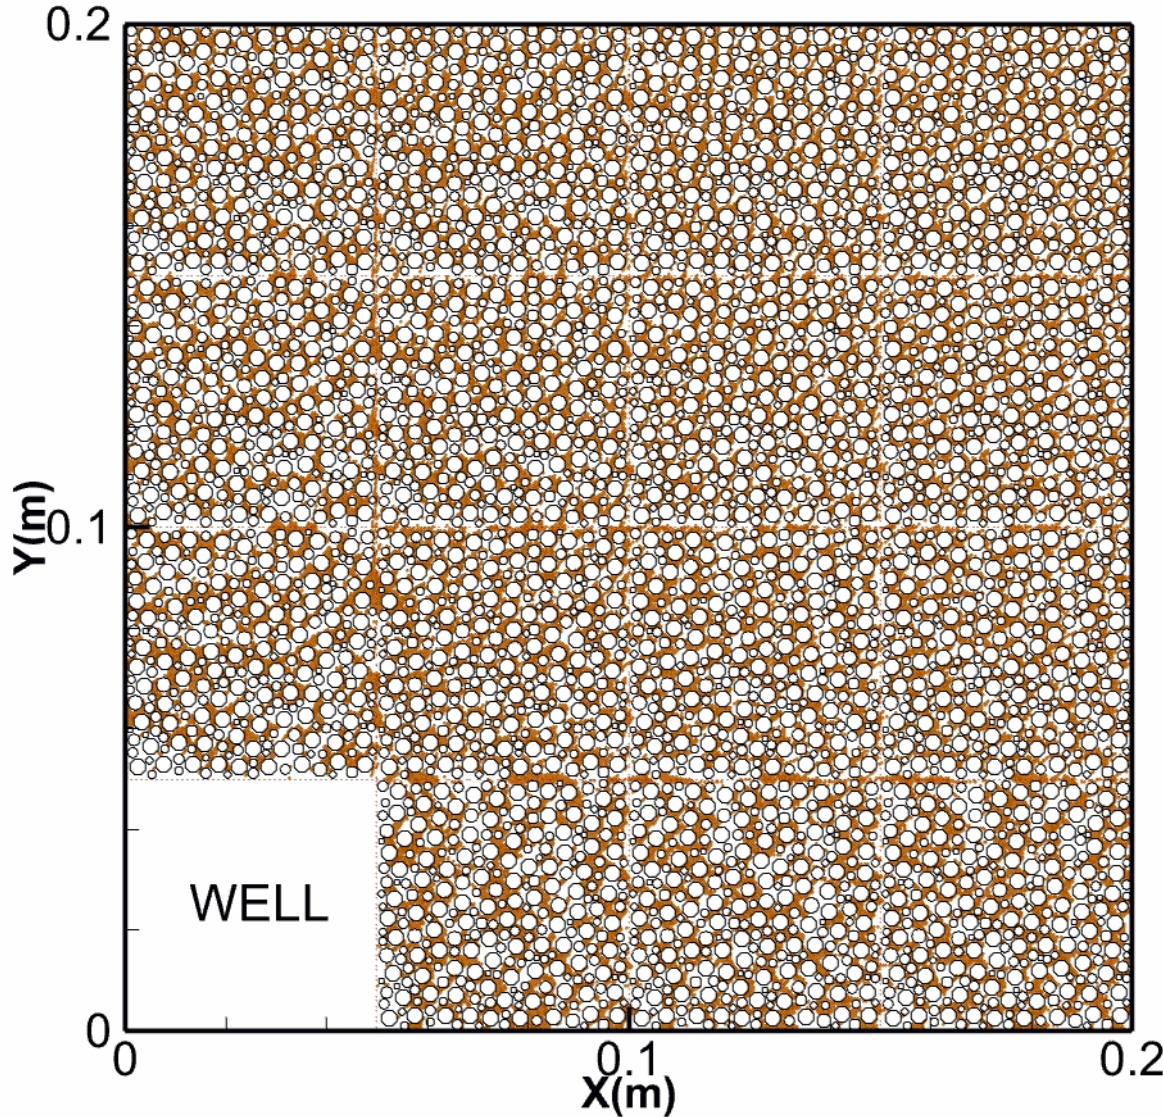

Case	Production time	Critical hydraulic gradient	Bottomhole pressure
<b>A1</b>	<b>3600 s</b>	<b>1.5E-5 m/s</b>	<b>10 MPa</b>
<b>A2</b>	<b>3600 s</b>	<b>1.5E-5 m/s</b>	<b>11 MPa</b>

# Reference Case A1: Animation

● Sand Particle ○ Rock Skeleton Time=10 s

- Sand detachment
- Sand migration
- Clogging of pore throat

# Reference Case A1: Animation

● Sand Particle ○ Rock Skeleton Time=10 s

- Sand detachment
- Sand migration
- Clogging of pore throat

# Reference Case A1: Animation

**Unobstructed paths for  
particle transport**

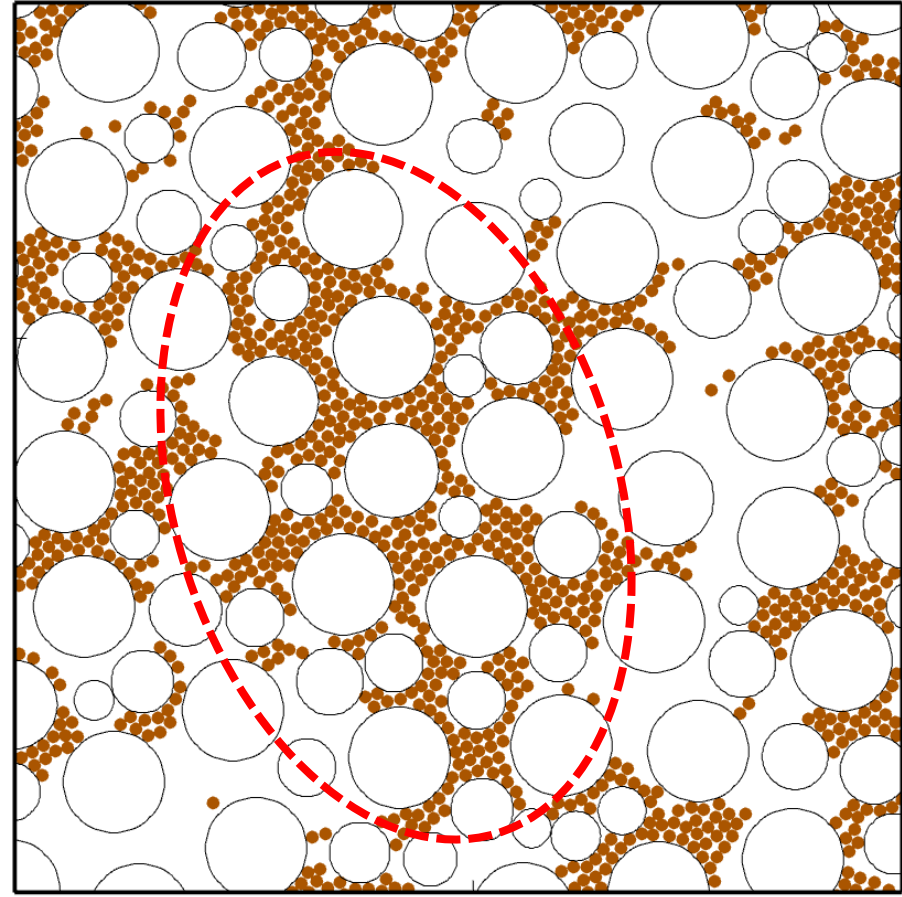

**Particles clogging  
around the well**

# Reference Case A1: Detail View

Time=200 s

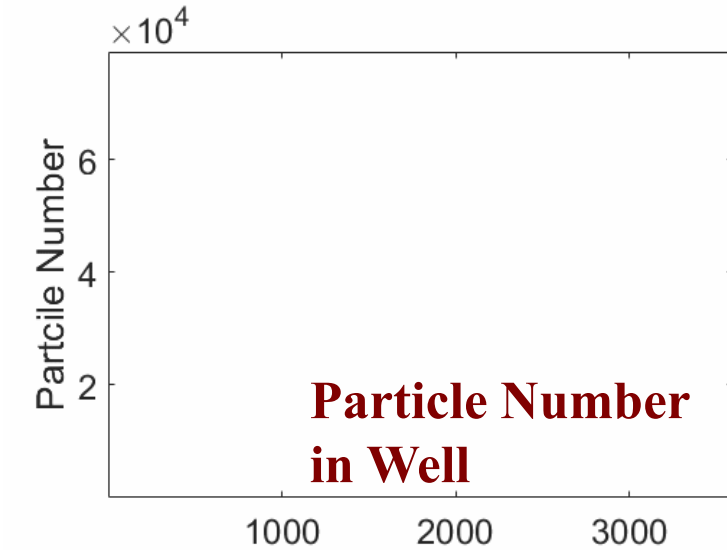

Time=200 s

● Sand Particle ○ Rock Skeleton

# Reference Case A1: Time Series Plots

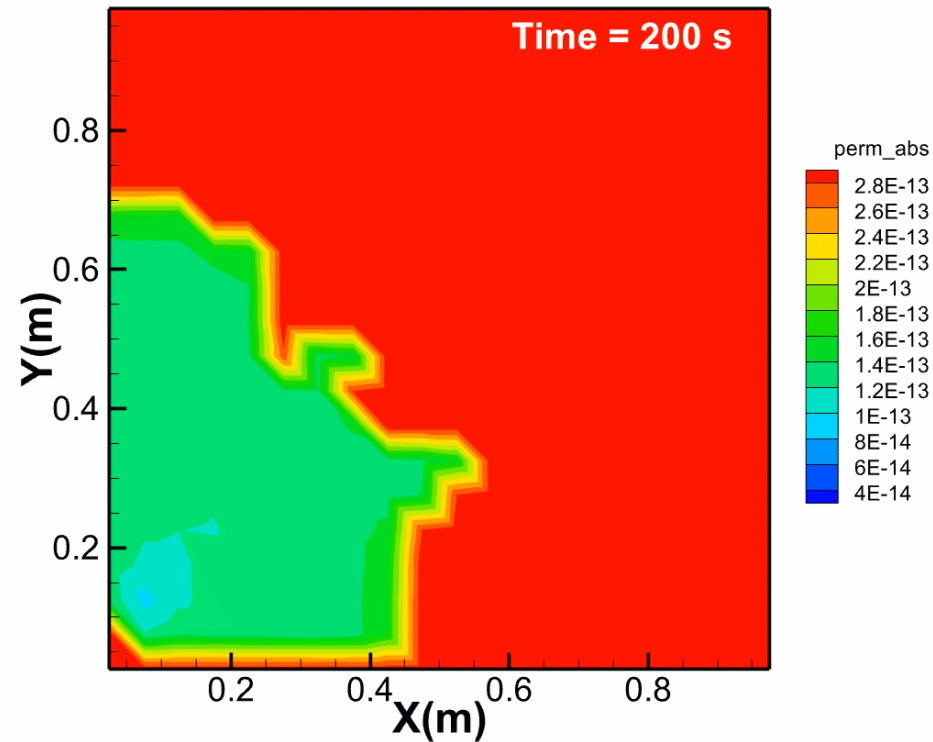

**Sand migration in porous media**

# Reference Case A1: P&k Evolutions

**P-distribution:**  
Production at a constant  
bottom-hole pressure

**k-distribution: decreases**  
due to particle clogging

# Effect of Bottomhole Pressure on Sand Production

## Particle Number in Well

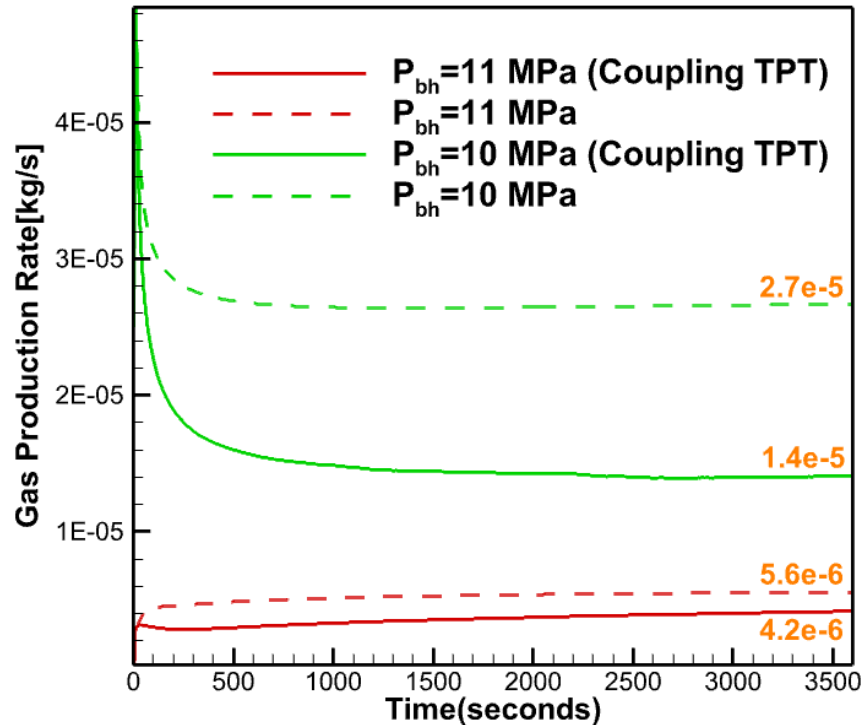

## Particle Number around Well

**Decreasing bottom-hole pressure:**

- corresponds to increasing sand production
- enhances particle clogging around the well

# Effect of Bottomhole Pressure on Production Rates

- Fluid production rates decrease with increasing sand accumulation in the well vicinity
- Variations in accumulated sand impact production rates

# Computational Cost

## Factors affecting calculation cost

- **Timestep:** limited by the maximum fluid velocity
- **Number of particles:** limited by the average fluid velocity and particle detachment criterion
- **Elapsed time of each iteration:** limited by the number of particles
- **Number of processors**

Case	Num Proc	Time (s)	$V_{cri}$ (m/s)	$P_{bh}$ (Mpa)	Num Particles	Simulation Time (hour)
A1	96	3600	$1.5 \times 10^{-5}$	11	<b>331,354</b>	<b>27.1</b>
A2	112	3600	$1.5 \times 10^{-5}$	10	<b>552,256</b>	<b>54.2</b>

# Computational Cost

## Main subroutines

- **P-P contact:** Particle-Particle contact searches
- **P-W contact:** Particle-Porous media wall contact searches
- **Matrix Solving:** Calculations of forces; integration of Euler's equation
- **Communication:** Sharing information across processors

**A2: Overall Time Statistics**

**Time Statistics of PT Calculations**

# Challenges

---

- Need for better mathematical expressions describing the particle detachment criterion (hydraulic gradient, strain, hydrate saturation, etc.)
- Wide variability of timestep adjustments (several affecting factors)
- Realistic grain structure of porous media
- Need for code validation against experimental results (?)
- Code enhancement to optimize computational efficiency
- Extension to 3D
