NETL CO₂ Capture Technology Project Review Meeting

August 17, 2018
Outline

- Project Team

- Project Objectives
  - Current challenges related with biological CO₂ capture
  - Our strategy
  - Project goal and objectives

- Technical Approach
  - Optimizing the pilot-scale photobioreactor algal cultivation
  - Developing a cascade biomass conversion process
  - Conducting TEA and LCA on the studied system
Dr. Yan (Susie) Liu
Biosystems and Agricultural Engineering, Michigan State University
Responsible for algal cultivation

Dr. Mitch Smith
Chemistry, Michigan State University
Responsible for catalysis of polymer synthesis

Dr. Angela Wilson
Chemistry, Michigan State University
Responsible for formulation of amino acid based absorbents

Dr. Wei Liao
Biosystems and Agricultural Engineering, Michigan State University
Responsible for system integration, TEA and LCA

Mr. Bill Clary, Mr. Dave Pavlik, Dr. Gary Allen, and Mr. Bob Morgan
PHYCO\textsubscript{2} LLC
Responsible for the reactor modification and pilot operation

Mr. Nate Verhanovitz and Mr. Bob Ellerhorst
The T.B. Simon Power Plant
Responsible for the connection between the pilot unit and the power plant operation
Current challenges related with biological CO$_2$ capture from flue gas

- Large algal cultivation systems required to completely capture CO$_2$ from a commercial coal-fired power plant (land and water demands)
  - Erickson Power Plant (150 MW): $\sim$3,000 metric ton CO$_2$ per day requires $\sim$150,000,000 m$^2$ area for the open pond reactor and $\sim$45,000,000 m$^3$ volume for the photobioreactor (based on the algae biomass productivity of 20 g/m$^2$/day)

- Stability and robustness of algal strains for long-term cultivation on flue gas
  - Robust strains that can grow on flue gas for an extended period (months to years) without sterilization requirement are critical to sustain the algal cultivation systems

- Lack of comprehensive solutions to efficiently and completely utilize algal biomass
  - Algal composition: 10~20% Lipid; 30-50% Carbohydrate; 30-60% Protein
Project Objectives

Our strategies

Synergistically integrating biological and chemical processes to efficiently capture CO₂ from flue gas and completely utilize the algal biomass for value-added chemical and fuel production.
The goal:

The goal of the proposed project is to develop a combined biological and chemical system for coal-fired power plants to generate bio-based CO$_2$ absorbent and other value-added products.

Project objectives:

1. Optimizing the growth of the selected algal strain to maximize biomass accumulation from the coal-fired flue gas

2. Developing a cascade biomass utilization to produce amino acid absorbents, polyurethanes, biodiesel, and methane

3. Conducting techno-economic analysis (TEA) and life cycle assessment (LCA) of the proposed process

The proposed biological and chemical algal cultivation system*

*: Solid black lines are the mass flow. Dashed blue lines are the energy flow. The red frame is the system that will be studied by this project.
Project Objectives

Expected outcomes of the project

- Long-term culture stability of the selected algal strains will be achieved using flue gas as the carbon source.
- Algal biomass productivity reaches **0.5-0.8 g/L/day** at a biomass concentration of **1.0-1.2 g/L** from the pilot operation.
- The cascade utilization process will achieve **nearly 100%** utilization of the algal biomass.
- The combined biological and chemical flue gas utilization will lead to a **technically sound and economically feasible system** to efficiently capture CO₂ in the coal-fired flue gas.

The pilot photobioreactor system in the T.B. Simon power plant

- a. T.B. Simon power plant; b. Flue gas pumping unit; c. Photobioreactor; d. Algae growing in the reactor; e. Centrifuge; f. Dryer
Technical Approach

1. Optimizing the pilot-scale photobioreactor algal cultivation

A. A robust algal strain from the Great Lakes Region

- A robust green alga, *Chlorella sorokiniana* MSU, has been selected from Great Lake region to capture algal biomass and produce algal biomass.

Changes of the algal assemblage during 5 months continuous culture

Algal community assemblages before (a) and after (b) cultured in AD effluent for 5 months

Effects of different wavelengths on algae
Technical Approach

1. Optimizing the pilot-scale photobioreactor algal cultivation

B. Pilot Operation

- This task optimizes and validates continuous algae cultivation using the pilot photobioreactors

- Pilot experiments
  - **The algal strain:**
    - The selected *Chlorella sorokiniana* MSU

  - **Culture system preparation:**
    - The **boiler water (12 mg/L TP)** is the water source for the culture.
    - The flue gas from the T.B. Simon power plant is the CO2 source.
    - Na2SO3 and NH4NO3 are used to mimic SO2 and NO2 in the flue gas.

  - **Operation of the algal cultivation:**
    - Flue gas flow rate: 12 L/min
    - Harvesting frequency: 12 hours and 24 hours
    - Harvesting amount: 30 L/harvesting, 50 L/harvesting, 60 L/harvesting, 70 L/harvesting
    - Key nutrients: NH4NO3, K2HPO4
    - Other flue gas component: Na2SO3
    - Trace nutrients: CaCO3, MgSO4, and FeCl2
Technical Approach

1. Optimizing the pilot-scale photobioreactor algal cultivation

B. Pilot Operation

- Biomass concentration (from March to August, 2018)
1. Optimizing the pilot-scale photobioreactor algal cultivation

B. Pilot Operation

- Nitrogen consumption (from March to August, 2018)

- Phosphorus consumption
Technical Approach

1. Optimizing the pilot-scale photobioreactor algal cultivation

- pH change (without pH control)

B. Pilot Operation

- NH$_4^+$ consumed
- NO$_3^-$ consumed
- NH$_4^+$ consumed
- NO$_3^-$ consumed

- N$_x$O in the flue gas could be beneficial for the pH control of the algal cultivation.
1. Optimizing the pilot-scale photobioreactor algal cultivation

B. Pilot Operation

- Biomass concentration and productivity

- 70 L harvesting with SO2 supplement had the highest (P<0.05) biomass productivity of 0.59 g/L/day.
- 50 L harvesting with SO2 supplement had the highest (P<0.05) biomass concentration of 1.36 g/L.
## Technical Approach

### 1. Optimizing the pilot-scale photobioreactor algal cultivation

2. Developing a cascade biomass conversion to produce amino acid absorbents, polyurethane, biodiesel, and methane

A. Flowchart

- **Expected outcomes**
  - The amino acid salt solutions have a high CO₂ absorption capacity of more than 0.5 mole CO₂/mole amino acids,
  - The cascade process can utilize all algal components (except ash) to fuels and polymers.
2. Developing a cascade biomass conversion to produce amino acid absorbents, polyurethane, biodiesel, and methane

B. High-efficiency protein extraction and hydrolysis

- Experimental design
  - **Ball milling:**
    - Ball material: Agate & Zirconia
    - Ball combination: 10 small balls (3 mm diameter), 10 medium balls (5 mm diameter), and 2 big balls (10 mm diameter)
    - Ball milling time: 0.5, 1, 2 hours
    - Temperature: 25 and 50ºC
  - **Alkali concentration:**
    - NaOH and KOH
    - Six concentrations: 0.05, 0.1, 0.2, 0.3, and 0.4 mole/L

Jars and balls of different ball mill materials used by the project (a). Agate; (b). Zirconia; (c). Stainless steel

Technical Approach

2. Developing a cascade biomass conversion to produce amino acid absorbents, polyurethane, biodiesel, and methane

C. Optimization of mixed amino acid salt solution as a CO\textsubscript{2} absorbent (Under investigation)

- Molecular dynamic modeling of CO\textsubscript{2} absorption is being carried out based on the detailed amino acids and peptides information.

Chemical reactions of amino acid salt CO\textsubscript{2} absorption*

\begin{align*}
\text{Amine formation:} & \quad \text{OOC-R-NH}_3^{\text{+}} + \text{KOH} \rightarrow \text{K}^+ + \text{OOC-R-NH}_2 + \text{H}_2\text{O} \\
\text{carboxylate amino acid} & \quad \text{amine}
\end{align*}

\begin{align*}
\text{Carbamate formation:} & \quad \text{CO}_2 + 2\text{OOC-R-NH}_2 \leftrightarrow \text{OOC-R-NH-COO}^{-} + \text{OOC-R-NH}_3^{\text{+}} \\
\text{carbamate} & \quad \text{carboxylate}
\end{align*}

\begin{align*}
\text{Carbamate hydrolysis:} & \quad \text{OOC-R-NH-COO}^{-} + \text{H}_2\text{O} \leftrightarrow \text{OOC-R-NH}_2 + \text{HCO}_3^{-} \\
\text{bicarbonate} & \quad \text{bicarbonate}
\end{align*}

\begin{align*}
\text{Biocarbonate formation:} & \quad \text{CO}_2 + \text{OOC-R-NH}_2 + \text{H}_2\text{O} \leftrightarrow \text{OOC-R-NH}_3^{\text{+}} + \text{HCO}_3^{-}
\end{align*}

*: From: J.P. Brouwer, TNO Science & Industry, The Netherlands

Molecular dynamic simulation (a) before and (b) after formation of carbamate. From: Ma, C et al. 2014. J. Phys. Chem. Lett. 5. 1672-1677
Technical Approach

2. Developing a cascade biomass conversion to produce amino acid absorbents, polyurethane, biodiesel, and methane

D. One-pot synthesis of biopolyol for polyurethane production (Under investigation)

- The spent amino acids are mixed with ethylenediamine and then ethylene carbonate in a single reactor with different reaction conditions to produce hydroxyl-terminated polyols.
- The resulted polyol is blended with isocyanate by a high-torque mixer to produce polyurethane foam.

MDI: methylene diphenyl diisocyanate

Amino-acid-based polyol formation
3. Conducting TEA and LCA on the studied system
   A. Mass balance analysis (Under investigation)

- The preliminary mass balance analysis is based on the proposed system (not including the power plant operation) for a 150 MW coal-fired power plant.
- The power plant burns subbituminous coal and generates 1.2 million metric tons of CO₂, 6,000 metric tons of N₂O, and 3,000 metric tons of SO₂ per year.

---

**Technical Approach**

**3. Conducting TEA and LCA on the studied system**

**A. Mass balance analysis (Under investigation)**

- The preliminary mass balance analysis is based on the proposed system (not including the power plant operation) for a 150 MW coal-fired power plant.
- The power plant burns subbituminous coal and generates 1.2 million metric tons of CO₂, 6,000 metric tons of N₂O, and 3,000 metric tons of SO₂ per year.
3. Conducting TEA and LCA on the studied system

A. Mass balance analysis (Under investigation)

- The preliminary mass balance analysis is based on the proposed system (not including the power plant operation) for a 150 MW coal-fired power plant.
- The power plant burns subbituminous coal and generates 1.2 million metric tons of CO₂, 6,000 metric tons of N₂O, and 3,000 metric tons of SO₂ per year.

- 223 kg CO₂ captured by algae
- 1,400 m³ of the reactor volume
- 3,2 million kg CO₂ captured by algal amino acid salt solution
- 1 kg diesel, 115 kg methane, and 1,400 kg polymer produced every day
3. Conducting TEA and LCA on the studied system

B. Energy balance analysis (Under investigation)

- The energy balance analysis is based on the previous mass balance.
- The 150 megawatts coal-fired power plant generates 14,416,457 GJ/year for both electricity and heat.

<table>
<thead>
<tr>
<th>System components</th>
<th>Energy value (GJ/year)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The proposed system b</td>
</tr>
<tr>
<td><strong>Chemical production</strong></td>
<td></td>
</tr>
<tr>
<td>Energy input</td>
<td>-2,184</td>

</tr>
<tr>
<td>Total energy output</td>
<td>1,920</td>
</tr>
<tr>
<td><strong>Net energy</strong></td>
<td>-2,759,469</td>
</tr>
</tbody>
</table>

a. Data used in the calculation are from the pilot scale algal cultivation and previous lab-scale utilization experiments. The energy input is assigned as negative. The energy out is assigned as positive.
b. The proposed system consists of algae photobioreactor cultivation, cascade biomass utilization, and CO₂ capture.
c. The single amino acid salt process includes both amino acid production and amino acid salt absorption.
d. The MEA process includes MEA production and MEA CO₂ capture.
3. Conducting TEA and LCA on the studied system

C. Economic analysis (Under investigation)

- The economic analysis is based on the previous mass balance and energy balance.
- The economic analysis does not include the capital cost.

Cost comparison between the proposed CO₂ capture system, commercial amino acid salt process, and MEA-based process:

<table>
<thead>
<tr>
<th>System components</th>
<th>The proposed system</th>
<th>The amino acid salt process</th>
<th>MEA process</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operational cost ($/year)</td>
<td>-400,000</td>
<td>-360,036</td>
<td>-120,000</td>
</tr>
<tr>
<td>Income ($/year)</td>
<td>849,018</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Revenue ($/year)</td>
<td>449,018</td>
<td>-360,036</td>
<td>-120,000</td>
</tr>
</tbody>
</table>

a. The cost is assigned as negative. The income is assigned as positive. The capital cost is not included in the analysis. It is assumed that the energy for CO₂ capture for all three processes are from residual energy. The cost of energy consumption is not included in the analysis.
b. The operation needs four operators ($60,000/operator/year). The cost of maintenance and other supplies is $160,000. With the current price of biodiesel ($1.25/kg), polyurethane ($2/kg), and methane ($0.42/kg), the annual income would be $849,018.
c. The amino acid cost (based on lysine) is $3/kg. The amount of amino acid required is 120,012 kg.
d. The MEA cost (Monoethanolamine) is $1/kg. The amount of MEA required to capture 1.2 million ton CO₂ is 120,000 kg.
3. Conducting TEA and LCA on the studied system

D. Life cycle assessment (LCA) (Under investigation)

- GREET and Excel are used as the tools to carry out LCA using the same boundary for TEA.
- Greenhouse gas emission and other environmental impact factors are targeted as the outputs of the LCA.

Procedure of TEA and LCA
