

# NATIONAL ENERGY TECHNOLOGY LABORATORY

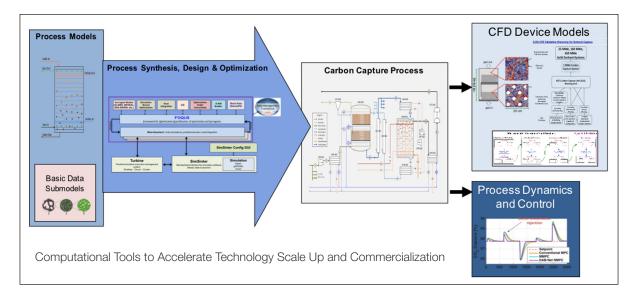

## **PROJECT DESCRIPTION**

CCSI<sup>2</sup> is led by the National Energy Technology Laboratory (NETL), partnering with Lawrence Berkeley National Laboratory, Lawrence Livermore National Laboratory, Los Alamos National Laboratory, Pacific Northwest National Laboratory, Oak Ridge National Laboratory, University of Toledo, University of Pittsburgh, University of Notre Dame, Carnegie Mellon University, University of Texas at Austin and West Virginia University.

CCSI² develops, validates, and applies advanced computational techniques for technology simulation, optimization, uncertainty quantification (UQ), and process control. Computational products are consolidated in the CCSI Toolset software for developing rigorous understanding of CO₂ capture technologies that enable efficient Research and Development (R&D). CCSI² develops a detailed multi-scale understanding of the most effective pathways to minimize the cost to capture CO₂. Between FY18 and FY20, CCSI² has directly supported ten projects in the Capture Program, with an investment of more than \$80M. Simultaneously, CCSI² has provided industry-wide benefit by applying a general Design of Experiments framework that optimizes large- and small-scale test programs, as well as highly accurate benchmark CO₂ solvent system modeling tools.

The primary goal of CCSI<sup>2</sup> is to provide a fundamental and interdependent understanding of CO<sub>2</sub> capture material, device, and system level performance leading to more informed R&D guidance on CO<sub>2</sub> capture technology development and reduced risks during commercialization. To achieve this goal, CCSI<sup>2</sup> will:

- Provide R&D support that reduces risk and increases rate of CO<sub>2</sub> capture technology commercialization
- · Generate accurate understanding and quantified uncertainty in CO<sub>2</sub> capture system performance
- · Continue to validate, apply and disseminate the CCSI Computational Toolset

## PROJECT BENEFITS

CCSI<sup>2</sup> is focused on simultaneously accelerating and de-risking research and development of CO<sub>2</sub> capture technologies. Efforts in CCSI<sup>2</sup> reduce the timeline and cost to commercialize technologies capable of cost-effectively achieving deep CO<sub>3</sub> reduction from the fossil fuel power generation industry. Rooted in mathematical optimization frameworks, the computational methods employed by CCSI<sup>2</sup> ensure the best operation, configuration and minimized costs for low carbon fossil fuel generated electricity. While initiatives continue to improve fossil fuel processing in the short-term, NETL is working with our partners to achieve a responsible transition in the future to heavier reliance on renewable energy resources.

## ACCOMPLISHMENTS/SUCCESSES

CCSI<sup>2</sup> has developed a standard solvent-based CO<sub>2</sub> capture system modeling framework with fundamental, multi-hierarchical characterization that will be used by the international CO<sub>2</sub> capture industry to inform technology testing and development.

Leveraging this fundamental modeling approach, a general framework for optimal steady state design of experiments (DoE) has been applied to pilot scale testing to increase precision of CO<sub>2</sub> capture models to +/-3% in a matter of weeks as opposed to years in conventional approaches. This DoE uses principles of Artificial Intelligence (AI) to generate testing requirements for most efficient and informative experimental data generation. This approach simultaneously improves model uncertainty and maximizes impact of test programs at all scales and technology readiness levels.

CCSI<sup>2</sup> is performing multi-scale optimization of several CO<sub>2</sub> capture systems under development by the Fossil Energy Carbon Capture Program. Projects include: University of Texas at Austin—Advanced Solvent Configurations; Lawrence Livermore National Laboratory—Device Scale Advanced Manufacturing; Oak Ridge National Laboratory—Intensified Packed Column Design; Lawrence Berkeley National Laboratory-Metal Organic Frameworks (MOFs); Pacific Northwest National Laboratory—Low-Aqueous Solvents.

### **Research Partners**

Leidos Research Support Team (LRST) | Lawrence Berkeley National Laboratory | Lawrence Livermore National Laboratory | Los Alamos National Laboratory Pacific Northwest National Laboratory | Oak Ridge National Laboratory | University of Kentucky | University of Texas at Austin | West Virginia University University of Notre Dame | University of Pittsburgh | University of Toledo | Carnegie Mellon University

### Contacts

### Benjamin Omell

Technical Project Lead Research Engineer benjamin.omell@netl.doe.gov

### Michael Matuszewski

Associate Technical Director Carbon Capture Simulation for Industry Impact (CCSI<sup>2</sup>) michael.matuszewski@netl.doe.gov

### **David Miller**

Technical Director, CCSP Senior Fellow Process Systems Engineering Research Team david.miller@netl.doe.gov

### **Anthony Burgard**
